# Chapter 3 - Plan Design

---

## TABLE OF CONTENTS

<b>CHAPTER 3.....</b>	<b>3</b>
<b>3.1 Plan File Creation .....</b>	<b>3</b>
3.1.1 File names.....	3
3.1.2 Design File Sheet Numbering.....	4
3.1.3 Seed Files.....	6
3.1.3.1 New MicroStation Seed Files .....	7
3.1.3.2 Unchanged MicroStation Seed Files .....	7
3.1.3.3 Operating Parameters .....	9
<b>3.2 Title Sheet.....</b>	<b>10</b>
3.2.1 Create a new file in Falcon .....	10
3.2.1.1 Select appropriate Seed file .....	10
3.2.1.2 Create alignment and sheet layout in the center of the title sheet. ....	10
3.2.1.3 Complete Title Sheet .....	11
3.2.1.4 All text sizes.....	11
3.2.1.5 Sample Title Sheets.....	12
3.2.1.6 Critical Infrastructure Information .....	13
3.2.1.7 Digital Signatures.....	13
<b>3.3 Location Map.....</b>	<b>14</b>
3.3.1 Create a Location Map Sheet. ....	14
3.3.2 Find Location Maps.....	15
3.3.2.1 Reference appropriate county map to design file.....	18
3.3.3 County Map DGN Files .....	18
<b>3.4 Index of Sheets .....</b>	<b>21</b>
<b>3.5 General Notes .....</b>	<b>22</b>
3.5.1 Create a new General Notes Sheet.....	22
3.5.1.1 Create a new file in Falcon .....	22
3.5.1.2 Access the general note macro .....	22
3.5.1.3 Instructions for Labeling General Notes Plan Sheet using macro.....	22
3.5.1.4 Access the general note cell library.....	23
3.5.1.5 Contents of General Notes Sheet.....	24
3.5.1.6 Add any special or non-standard notes .....	24
3.5.1.7 Complete the sheet title block .....	24
<b>3.6 Cross Section Labeling.....</b>	<b>26</b>
3.6.1 Instructions for Labeling Cross Section Plan Sheets.....	26
3.6.2 Examples of Cross Section Labeling .....	27
<b>3.7 Macros .....</b>	<b>28</b>
3.7.1 VDOT Macros .....	28
<b>3.8 Roadway Typical Sections .....</b>	<b>29</b>
3.8.1 Changes Allowed in Typical Sections.....	29
3.8.2 Typical Section Sheet in Falcon.....	29
3.8.2.1 Create a new file.....	29
3.8.2.2 Fill in all pertinent information.....	29
3.8.2.3 Place appropriate cell(s).....	29
3.8.2.4 Examples of Typical Section Sheet.....	30

<b>3.9</b>	<b>Roadway Design for Total CADD.....</b>	<b>32</b>
3.9.1	Development of Plans.....	32
	3.9.1.1 Create the master design file.....	32
	3.9.1.2 Attach Cell Libraries.....	32
	3.9.1.3 Keep Master Design files intact.....	33
3.9.2	Alignments.....	33
3.9.3	CADD Development.....	34
	3.9.3.1 Use of Levels, Weights, Line Codes, and Colors.....	34
	3.9.3.2 Annotation Instructions.....	34
	3.9.3.3 Plots for PFI Meeting.....	35
	3.9.3.4 Use of CADConform Software.....	35
	3.9.3.5 Pattern Reference File.....	36
	3.9.3.6 Requesting a merged DTM file.....	36
3.9.4	Development of Plans for Preliminary Field Inspection.....	37
	3.9.4.1 Incorporate changes requested from the PFI Meeting into design file.....	37
	3.9.4.2 Create Base Plan Sheets.....	37
	3.9.4.3 Develop Design in Greater Detail.....	38
	3.9.4.4 Construction Limits.....	38
	3.9.4.5 Intermediate Prints/PDFs.....	38
	3.9.4.6 Right of Way and Easements.....	38
	3.9.4.7 Critical Infrastructure Information/Sensitive Security Information.....	38
3.9.5	Traffic Maintenance Plans (TMP).....	39
	3.9.5.1 Method 1.....	39
	3.9.5.2 Method 2.....	39
3.9.6	Develop Plans for Public Hearing.....	40
	3.9.6.1 General Guidelines for Public Hearing Plans Assembly.....	40
3.9.7	Develop Plans for Right of Way.....	40
3.9.8	Develop Plans for Final Submittal.....	41
	3.9.8.1 Digitized Signatures.....	41
	3.9.8.2 Review.....	41
3.9.9	Revisions after R/W or Final Submittal.....	41
<b>3.10</b>	<b>Standards/Special Design Section.....</b>	<b>44</b>
3.10.1	CADD Drawing Standards (Imperial) MicroStation.....	44
	3.10.1.1 Imperial Working Units.....	44
	3.10.1.2 Coordinate Readout.....	44
	3.10.1.3 Angles.....	44
	3.10.1.4 Standard Levels, Weights and Text Size.....	45
	3.10.1.5 Insertable Sheets.....	47
3.10.2	Revisions to Insertable Sheets.....	47
3.10.3	Referencing PDF insertable sheets to a MicroStation V8i file.....	47
	3.10.3.1 Instructions for referencing PDF insertable sheets:.....	48
<b>3.11</b>	<b>Plotting.....</b>	<b>53</b>
3.11.1	Plotting with Microstation.....	53
	3.11.1.1 Sheet sizes.....	53
3.11.2	Plotting with MicroStation V8i.....	55
	3.11.2.1 Logical Names and Plotting.....	59
3.11.3	Print Organizer (Batch Plotting).....	61
3.11.4	Plotting from Falcon Web.....	67
	3.11.4.1 Using the Print Application.....	67

## Tables and Figures

Table 3-1	File Naming Conventions .....	3

Figure 3-6	Metric Title sheet.....	12
Figure 3-7	General Notes sheet .....	25
Figure 3-8	Imperial Typical Section Sheet.....	30
Figure 3-9	Metric Typical Section Sheet.....	31
Figure 3-10	Sheet Plotting Scales.....	54

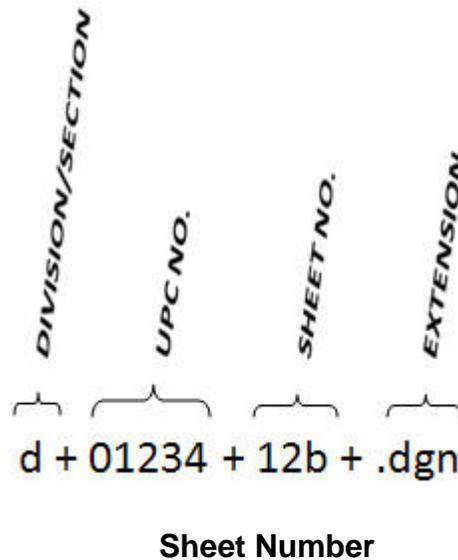

# Chapter 3

## 3.1 Plan File Creation

### 3.1.1 File names

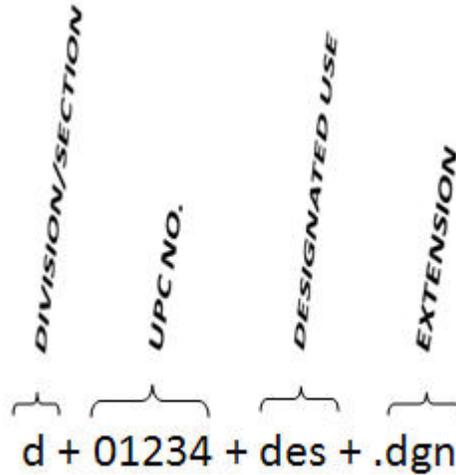

Use consistency in assigning file names to CADD design files to insure that future searches for the files is a simpler task. The following naming convention shall be used on all CADD files:

**DIVISION + UPC # + DESIGNATED USE/SHEET NUMBER + EXTENSION**

**Table 3-1 File Naming Conventions**

<b>EXAMPLE:</b>	<b>d3850des.dgn</b> (master design file for UPC# 3850)
	<b>d3850prof.dgn</b> (master profile file for UPC# 3850)
	<b>d3850xs.dgn</b> (master cross section file for UPC# 3850)
	<b>d385003.dgn</b> (design file for sheet 3 UPC# 3850)
	<b>d385012b.dgn</b> (design file for sheet 12b UPC# 3850)

### Designated Use

\*For Cross-Section Files' naming conventions, see [Creating Cross-Section Plot File for Electronic Submission](#) in section D.9 in Appendix D.

The CADD File Name *is NOT* limited but we recommend that file name is no more than Twenty (20) CHARACTERS in length with a three-character extension. EXAMPLE: d1234508(12).dgn. Special Characters should be limited to ( ), \_, and -.

The Local directory path may be C:/documents/cfms\_local/3850/d3850/d385012b.dgn.

### 3.1.2 Design File Sheet Numbering

In accordance with sheet numbering standards as specified in the [Road Design Manual](#), each type of drawing has a specific sheet number or number range that must be used. The following is a list of these sheet numbering standards:

**Note: CADD Level Structure Sheet is no longer required in the Plan Assembly**

**Table 3-2 Sheet Numbering Conventions**

Sheet Name	Sheet Number
Title Sheet	01
Location Map Sheet	01a
Index of Sheets/Files Sheet	01b*
Right of Way Data Sheet	01c*
Revision Data Sheet	01d *
Stream Flow Hydrograph Sheet	01e*
Alignment Data Sheet	01f, g*
Underground Utility Test Hole Information Sheet	01h *
MOT/ SOC/ TMP Transportation Management Plans	01j*
General Notes	02
Typical Sections	02a (1st Typical Sheet)
Typical Sections	02b* (Additional Typical Sheets)
Details	02* (Detail Sheets, Summary Sheets, Insertable Sheets, Hydrologic Data Sheet, etc.)
Plan Sheets	03, 04, 05...
Right of Way Plan Sheets	03RW, 04RW, 05RW...
Utility Plan Sheets	03UT, 04UT, 05UT...
Profile Sheets	03a, 04a, 05a...
Drainage Description Sheets	03b*
Ancillary Plan Sheets	06**
Cross Section Sheets	1 – xxx ***

\*The Lead Design Engineer assigns the Alpha Letter to sheets. Numbering in the “1” series may need to be adjusted to allow for the exclusion of sheet(s), such as the Project Location Map.

\*\*Ancillary plans(Utility Relocation, Lighting, Signs, Traffic Control Devices, Landscaping, Bridge, etc.), which are to be incorporated into the Plan Assembly, are to be assigned PLAN SERIES NUMBERS BEGINNING AFTER THE LAST PLAN SHEET NUMBER BY THE LEAD DESIGN ENGINEER, in coordination with the PROJECT MANAGER. [BRIDGE PLANS](#) have their own sheet numbering system. Place their plans after the Cross Sections in the plan assembly.

\*\*\* Main Cross Section Sheets are numbered and placed in accordance with GEOPAK sheet numbering.

### 3.1.3 Seed Files

Create all design files from a seed file. A separate and specific seed file has been developed for each type of design file. For example, there is a different seed file for metric or imperial plan sheets, general notes sheets, typical section sheets, etc. For additional information, see [MicroStation/OpenRoads Standards 2016](#) seed files.

#### **NOTE: New 2014 Format:**

Code of Virginia **Section 55-290 - Plane coordinates used in systems** states “The plane coordinates of a point on the earth's surface, to be used in expressing the position or location of such point in the appropriate zone of these systems, shall be expressed in **U.S. survey feet and decimals of a foot**. When converting coordinates in the Virginia Coordinate System of 1983 from meters and decimals of a meter to feet and decimals of a foot, the **U.S. survey** foot factor (one foot equals 1200/3937 meters) shall be used. “

**Currently VDOT uses imperial units in all MicroStation files. VDOT will continue to use the legacy seed files for existing projects life cycle (in imperial units) only.**

**In an effort to comply with the code listed above, VDOT is providing new seed files for NEW projects with units set to US Survey Feet for new project assignments after June 1, 2015. Files will note the seed file used to begin the project. All VDOT and consultant staff are responsible for verifying and using the proper seed file when work is assigned.**

**Any Microstation file that shows or reference the survey file will need to utilize the new seed files to comply with the change to US Survey Feet.**

### 3.1.3.1 New MicroStation Seed Files

Table 3-3 New Seed Files

Discipline	Name	Description
Design Files	geopakdesv14.dgn	Standard seed file for creating the design
Design Files	geopakdtmv14.dgn	Standard seed file for creating 3d files for Design
Design Files	geopakprofv14.dgn	Standard seed file for creating profiles
Design Files	geopakworkv14.dgn	Standard seed file for creating the work file
Design Files	Geopakworkv14.dgn	GEOPAK seed file for pattern lines, shapes, template separator., etc.
Survey	USFootSeed.dgn	Standard seed file for creating 2d files
Survey	USFootSeed3D.dgn	Standard seed file for creating 3d files
Right of Way	RWDATA.dgn	Standard Right of Way data table

**All other seed files remain the same. They do not deal with the survey file.**

### 3.1.3.2 Unchanged MicroStation Seed Files

Table 3-4 Seed Files

Name	Description
geopakxsht.dgn	GEOPAK seed file for cross section sheet file
guidesign.dgn	GuideSign seed file for sign design
mgeopakdes.dgn	Metric GEOPAK seed file for Master Design file

Name	Description
mgeopakdtm.dgn	Metric GEOPAK seed file for triangles and contour file
mgeopakprof.dgn	Metric GEOPAK seed file for Master Profile files
mgeopakwork.dgn	Metric GEOPAK seed file for pattern lines, shapes, template sep., etc.
mgeopakxs.dgn	Metric GEOPAK seed file for Master Cross Section Files
mgeopakxsht.dgn	Metric GEOPAK seed file for cross section sheet file
mpcseed.dgn	Metric seed file for Plan Coordination Section
mseed.dgn	generic Metric seed file
mseedpla.dgn	Metric seed file for Plan Sheet creation
mseedtil.dgn	Metric seed file for Title Sheet creation
mseedtyp.dgn	Metric seed file for Typical Section Sheet
mseed3d.dgn	generic Metric 3d seed file
matseedv8i.dgn	standard seed file for Gint
public hearing seed.dgn	Imperial seed file for Public Hearing Display
eng-ser seed.dgn	Imperial seed file for Insertable Sheet
Vdotseed.dgn	generic Imperial seed file

### 3.1.3.3 Operating Parameters

The above seed files have several operating parameters set specific to that sheets purpose and scale. Some of the parameters are as follows:

- Working units: Imperial -- FT, TH, 1000, 1  
Metric -- M, M, 1, 1000
- Global origin set to lower left (GO=0,0)
- Coordinate readout: Master Units to 4 decimal accuracy
- Angles: DD.DDDD, Conventional to 2 decimal display for Imperial projects, and 3 decimal display for metric projects
- All levels are turned on (ON=1-63)
- Data read-out is set to master units with a minimum of two decimal places displayed
- View control delays are turned off
- All fast displays are turned off
- Text node display is turned off

---

## 3.2 Title Sheet

---

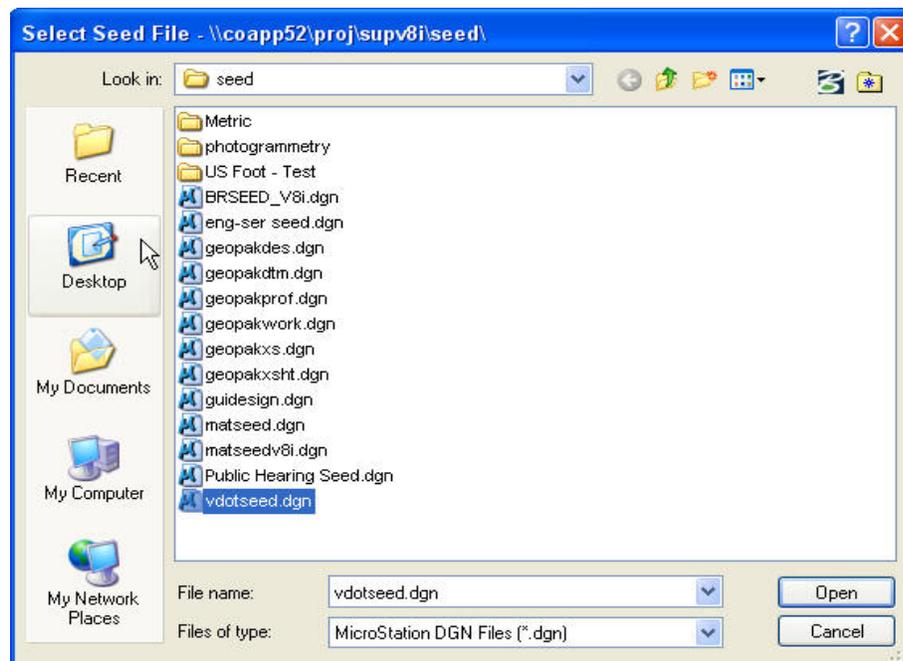

The following instructions are for creating a Title Sheet and apply to both Imperial and Metric units. (BOLD type denotes user key-ins and italics denote menu item selections.) For additional information, see [IIM-LD-204](#).

### 3.2.1 Create a new file in Falcon

Please see [Falcon Instructions](#), for additional information on the proper method of creating a new design files.

#### 3.2.1.1 Select appropriate Seed file

Select the proper Seed file (**V**DOT**S**EED.**D**GN for Imperial projects and **M**SEED**T**IL.**D**GN for Metric projects

#### 3.2.1.2 Create alignment and sheet layout in the center of the title sheet.

Attach the appropriate file (which contains the proposed alignment for project) as a reference file. If the proposed alignment differs greatly from the survey alignment, then reference the survey alignment into the file. Please see [Falcon Instructions](#), for proper method of referencing design files.

In the reference file containing the **PROPOSED ALIGNMENT** turn off all levels except levels **1** and **31** (Levels 21 and 31 if project were started prior to July 1, 1995) If the file containing the **SURVEY ALIGNMENT** is referenced turn off all levels except levels **1** and **31** (Levels 1 and 11 prior to July 1, 1995)

To turn off levels in reference file, choose **File** and **Reference** from the MicroStation Menu Bar. When the Reference Files dialog box opens, select the correct reference file, choose the Level Display option from the Settings menu, and turn off appropriate levels. It may be necessary to move the sheet border so that it encompasses the alignment file.

It may be necessary to reduce the scale of the reference file so that the entire alignment will fit neatly into the title sheet. If the project is short enough, you may want to consider increasing the scale of the references. To change the scale select **File** from the MicroStation Menu Bar and then select the **Reference** option. When the Reference File dialog box open, choose the **Scale** option from the **Tools** menu item and change the scale as necessary. **Take care that you have the appropriate reference file highlighted prior to changing the scale.** If you scale down the reference file, you will also need to scale up the text sizes proportionally so they are readable. Turn on reference level 31 that contains the 500' (100 M) station references. Copy station text into the title sheet file and place on level 61 (level 60 prior to July 1, 1995); then turn off reference level 31. To copy station text, use the **Element Selection Tool** to identify the text and then use the **Copy** command. When prompted for the second data point, key-in **DL=0**. Now turn off the reference level 31. Now all that should be visible is the alignment and the station calls. Scale up the station numbers so that they are readable.

The next step is to reference in the individual sheet files that have the sheet borders. Trace each border with a Line String on level 61 (level 60 prior to July 1, 1995), LC=3 and WT=3. When you are finished tracing each border, detach the individual sheet references. Now you should have the entire project alignment with 500' (100 M) station numbers and limits of each plan sheet shown in the center of the title sheet.

### 3.2.1.3 Complete Title Sheet

Complete Title Sheet by editing text for Project Number etc. If you use the **Find/Replace Text** command make sure the toggle for **In Cells** is turned on.

The **Find/Replace Text** command is under the **Edit** pulldown on MicroStation's Menu Bar.

### 3.2.1.4 All text sizes

All text sizes should be the same as text sizes on title sheet cell except description headings.

Set text sizes in headings as follows:

TX=48 LS=24 WT=10 Imperial

TX=12 LS=6 WT=10 Metric

The text size for project number below description is as follows:

TX=24 LS=12 WT=5 Imperial

TX=9 LS=4.5 WT=5 Metric

### 3.2.1.5 Sample Title Sheets

Figure 3-5 Imperial Title sheet

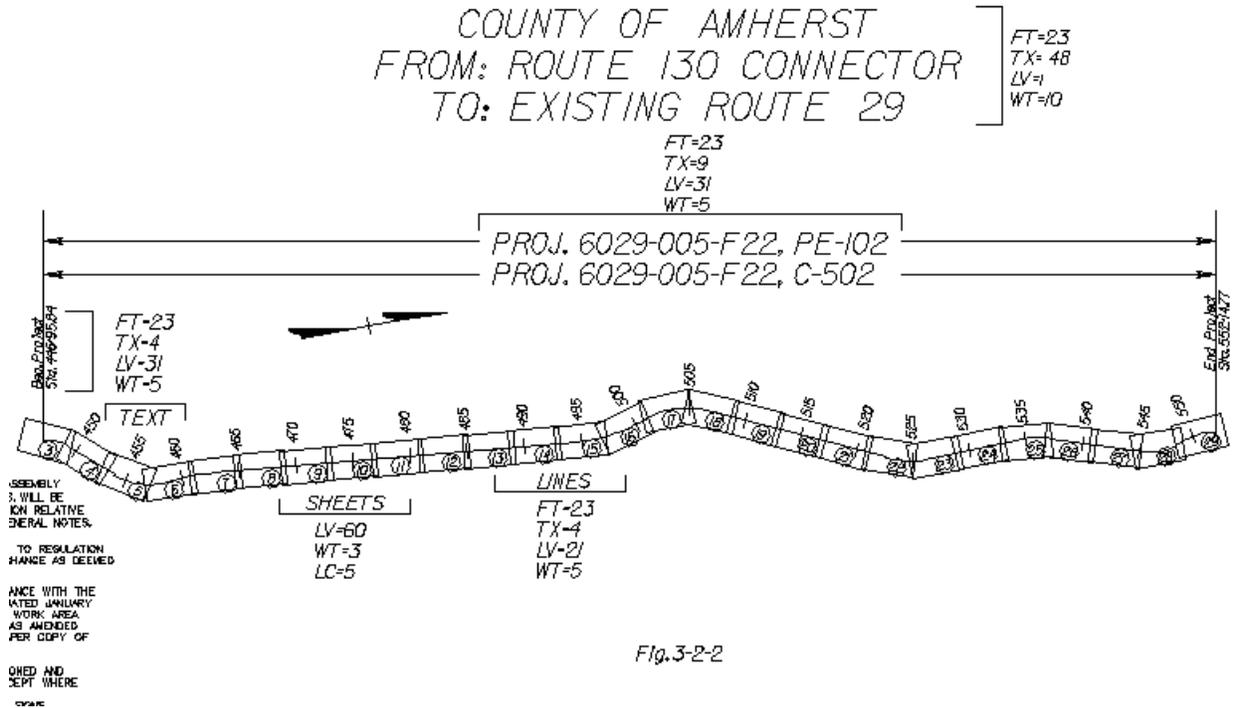

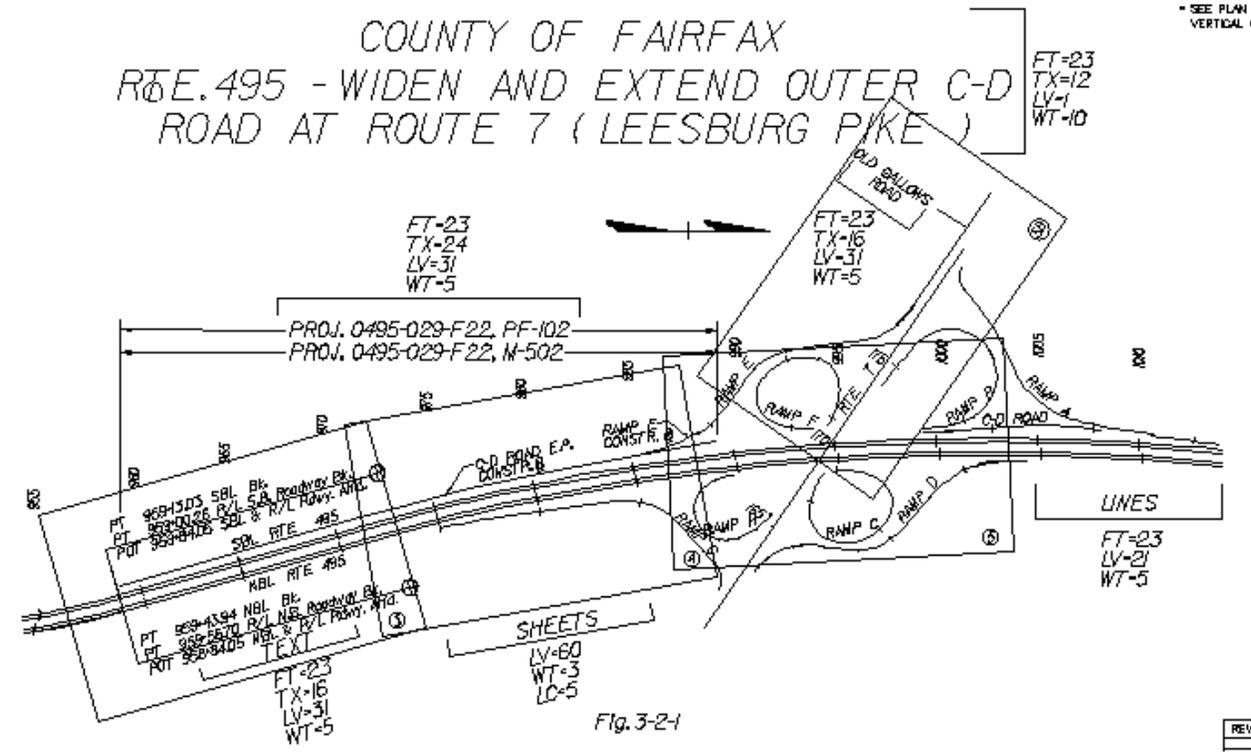

Figure 3-6 Metric Title sheet

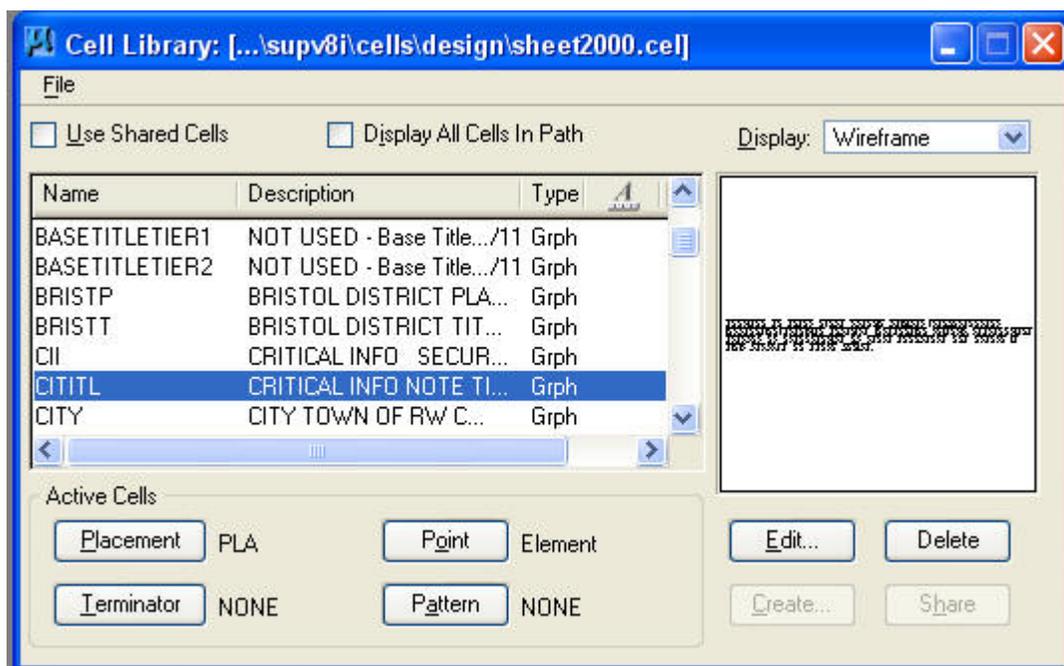

Sample title sheets (Imperial and Metric) shown with the appropriate text sizes, etc. This figure is for your reference and information only. For additional information, see the [Road Design Manual](#).

**NOTE:** There are times when some proposed work can be shown on title sheets but only when the project is very short and the title sheet scale is large.

### 3.2.1.6 Critical Infrastructure Information

A note for Critical Infrastructure Information/Sensitive Security Information has been created. Add this note to the title sheet when plans contain Critical and Sensitive information. The note cell is ***cititl*** and found in the **sheet2000** cell library.

### 3.2.1.7 Digital Signatures

All plans and documents submitted for Right of Way and Construction **on or after July 1, 2009** shall be sealed and signed by the Responsible Person(s), as defined in [IIM-LD-243](#) (Licensed Professional Engineer, Certified Landscape Architect or Licensed Land Surveyor). For Instructions on using Sealing and Signing Block, see [Appendix F of this Manual](#).

## 3.3 Location Map

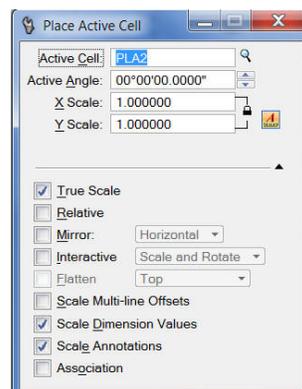

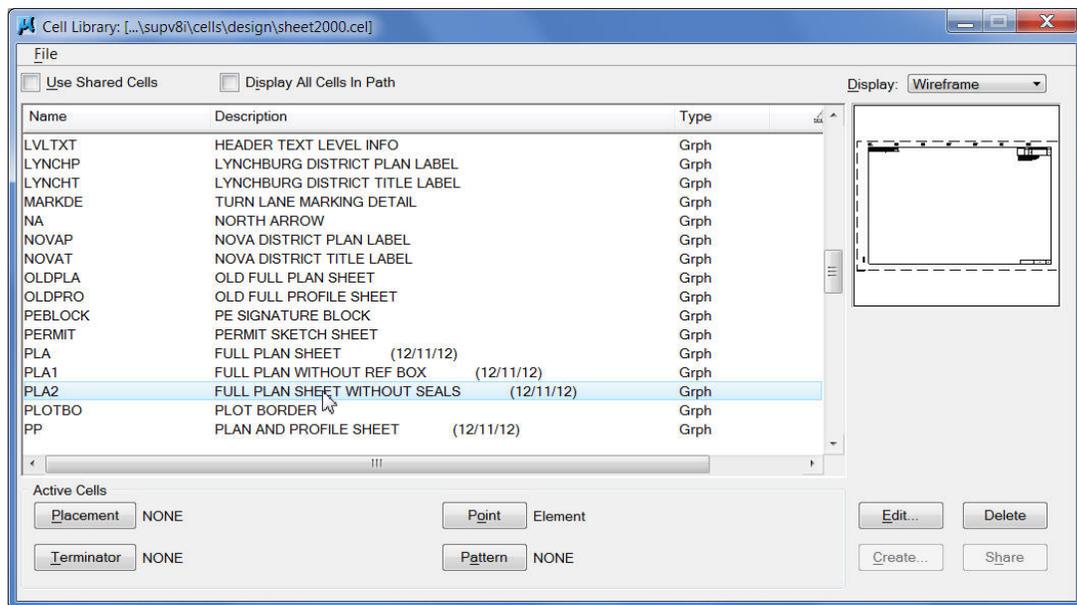

The following guidelines are to be used for creating a Location Map that applies to either Imperial or Metric projects. All of the County Maps are located in **InsideVDOT**. These maps are not modified for MicroStation use. Use **only** as **reference files**. Please **do not** try to **copy** the data into your Location Map file. The working units in the map files are not compatible with the working units in our standard graphics files.

### 3.3.1 Create a Location Map Sheet.

Please see [Falcon Instructions](#), for proper method of creating new design file.

Select the proper Seed file (**GEOPAKDES.DGN** for Imperial projects). Working Units for all maps are in Feet and Inches.

Place the sheet using the PLA2 cell from the sheet2000 cell library at a scale of 1. After sheet is created you can locate the county map you need.

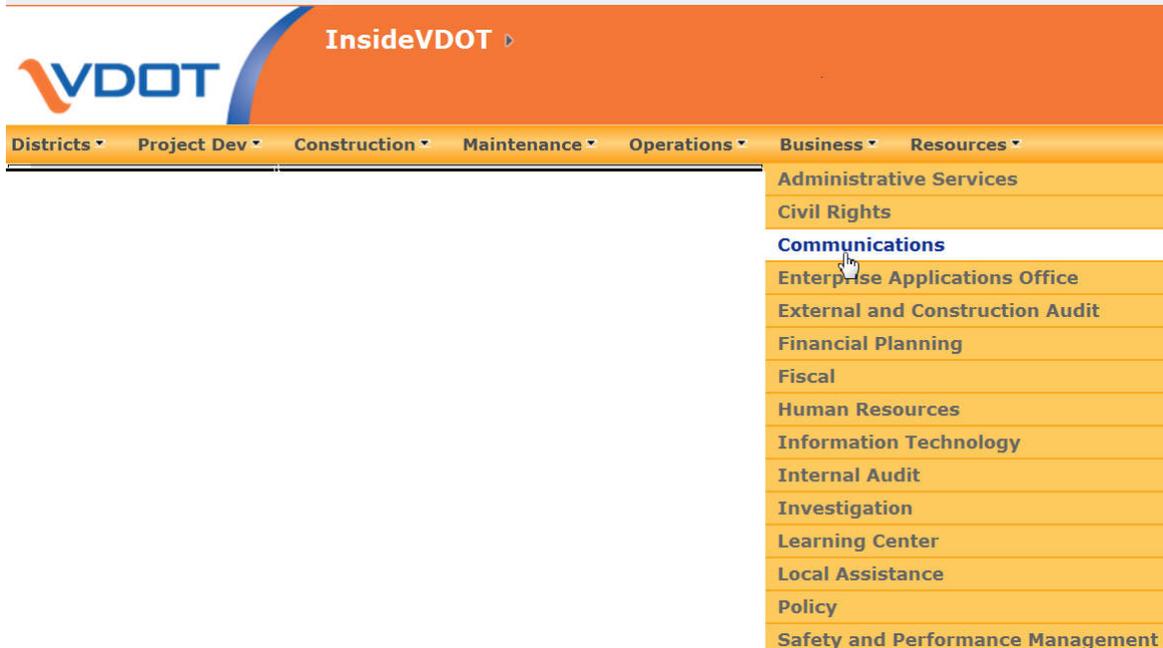

### 3.3.2 Find Location Maps

The most up to date County Maps are no longer located in Falcon, to access maps use this link: <https://insidevdot.cov.virginia.gov/div/pa/MAPS/SitePages/Home.aspx>

\*Consultants should contact the Project Manager for a copy of project maps if needed and then follow instructions for creating a Location Map Sheet.

Or

Go to **InsideVDOT** → **Business** → **Communications**:

Click on **Maps** on the sidebar: under Communications Program Areas:

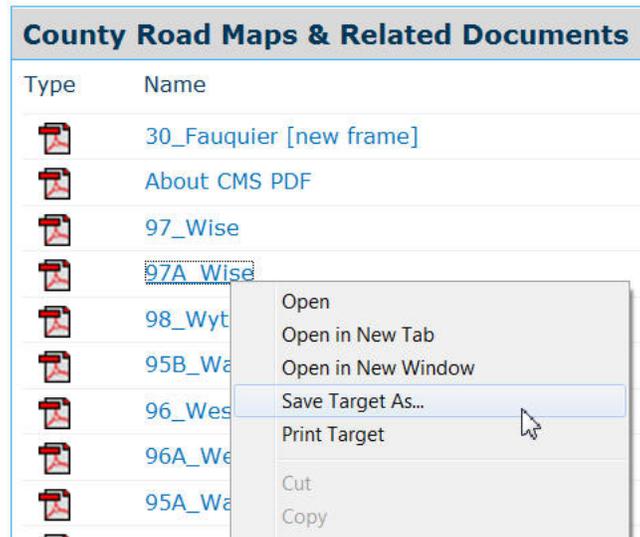

The maps are stored in both PDF and JPG format. Choose the **PDF** folder; it produces a crisper print in MicroStation.

County Road Maps & Related Documents

<a href="#">(More Items...)</a>		

Find correct County for your project, right click on name and select **Save Target As** :

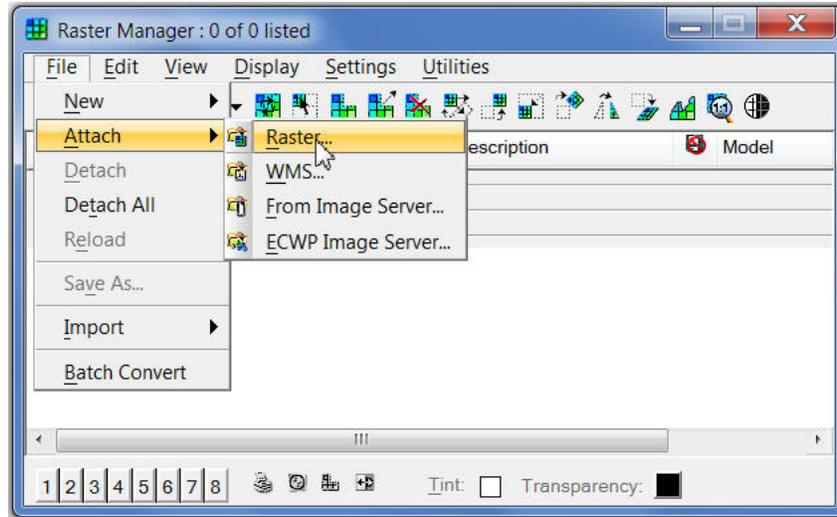

**Save File** (map) to your C:\documents\cfms\_local\UPC#\dUPC# folder. (This will need to be added to Falcon)

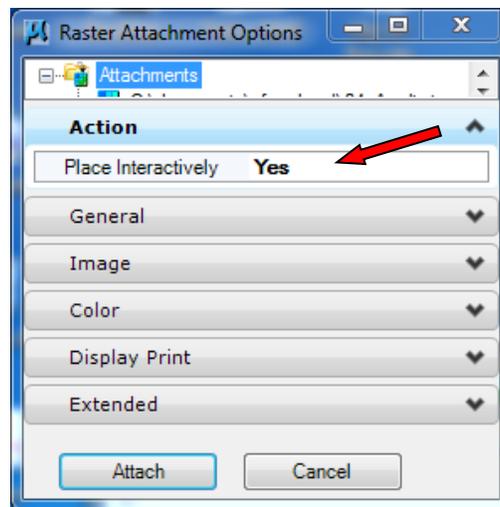

### 3.3.2.1 Reference appropriate county map to design file

The county map dgn file is stored in C:\documents\cfms\_local\UPC#\dUPC# folder. The UPC # is county maps and the division is the county you select to work with. In MicroStation, go to **File**→ **Raster Manager**

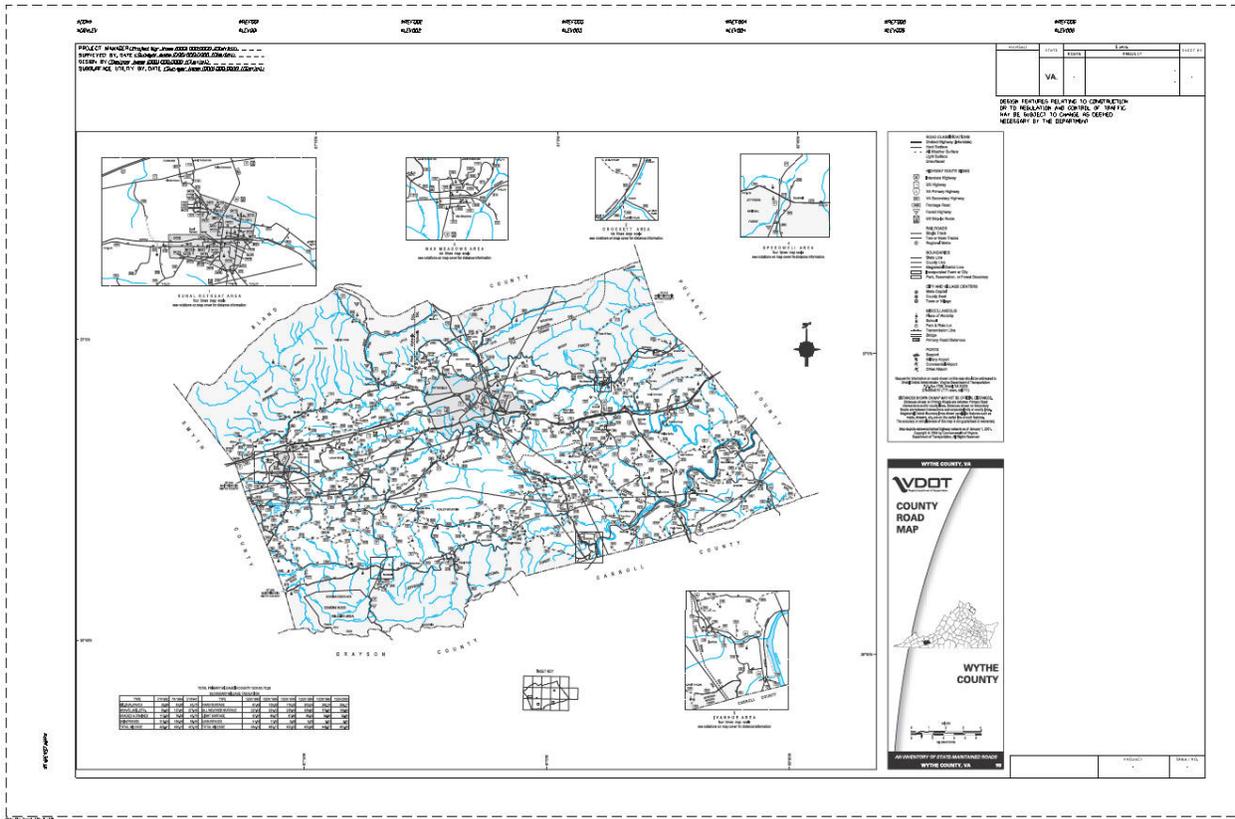

Navigate to your map you saved in C:\documents\cfms\_local\UPC#\dUPC# folder, Select the map and click **Open**. Be sure to set the Attachment Options to **Place Interactively**. Click on **Attach**.

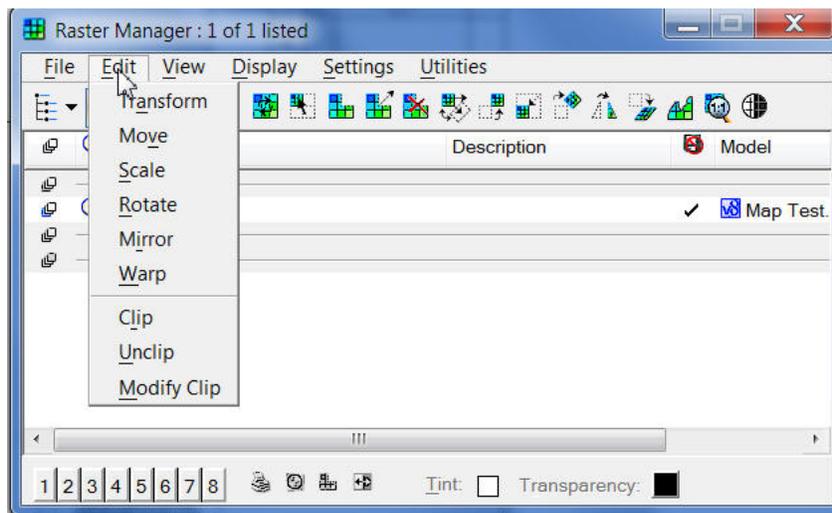

### 3.3.3 County Map DGN Files

Select a point inside the lower left of your plan sheet and then at the upper right. A dashed outline of the map will follow your cursor. Once you select the top right your map will appear. If you wish to use the whole county map as shown, you are done. If you need to manipulate it, continue on.

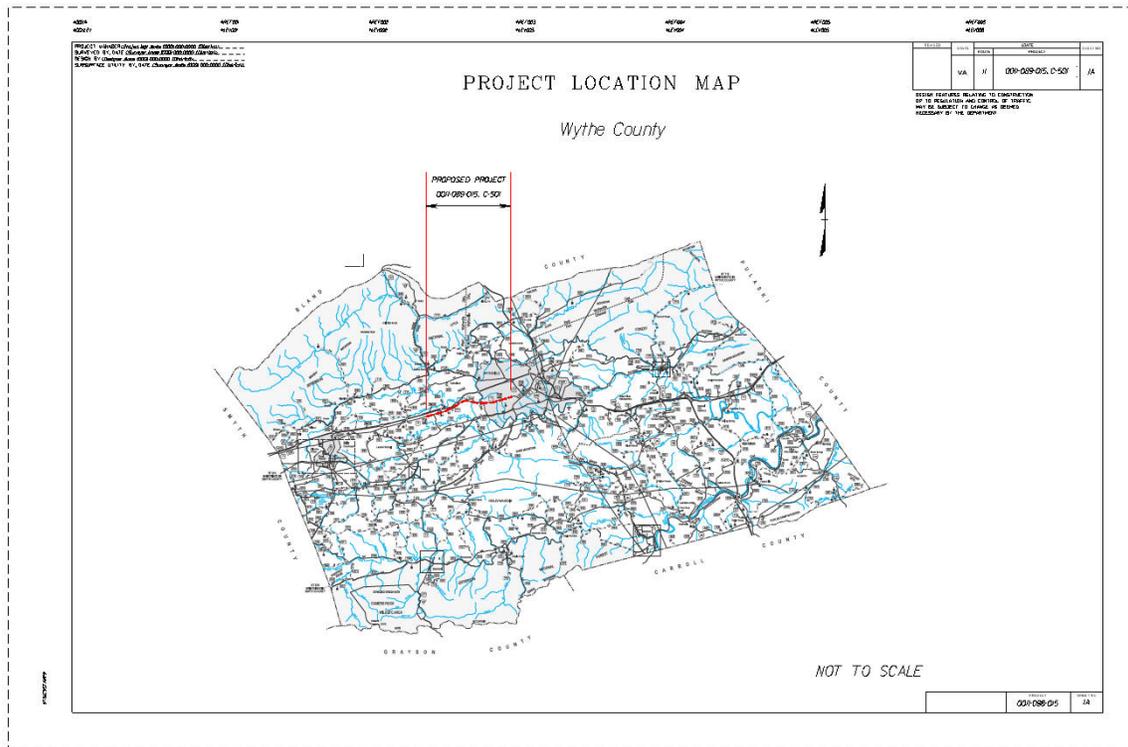

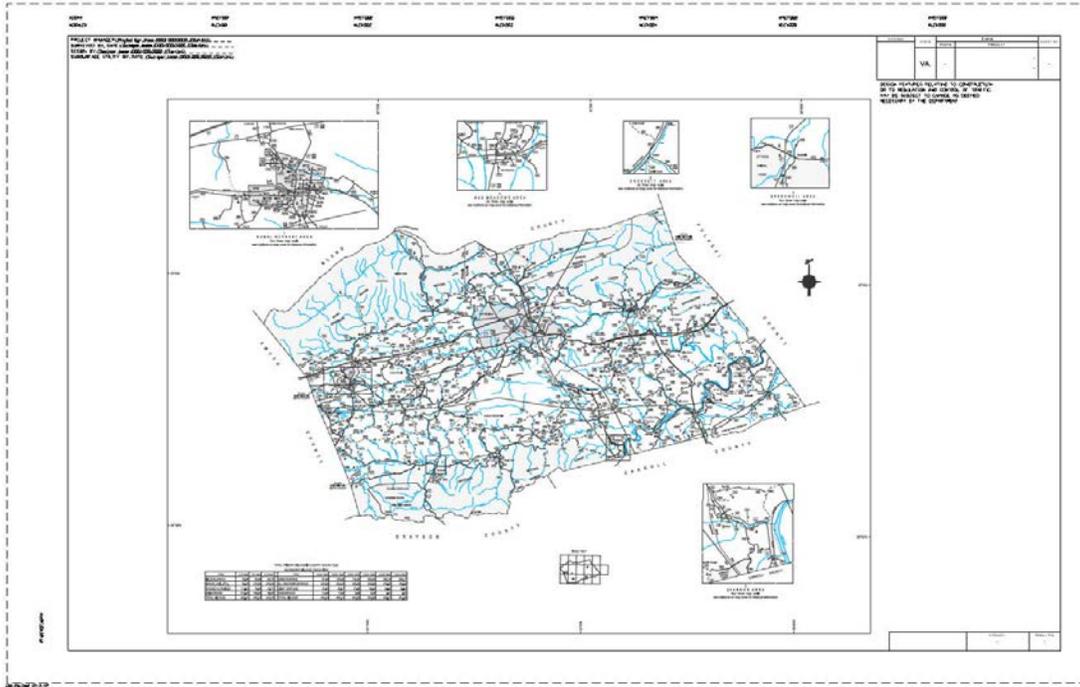

To get a smaller section of the map blown up, it is recommended to scale your plan sheet down by .5 (50 scale plot) or .25 (25 scale plot) as needed.

To modify maps go to from the **Raster Manager Dialog**, select **Edit** → **Clip**. Enter two data points inside your plan sheet and a third data point to accept. (This works the same as reference files) or if you want to clip a shape use the **Fence Command** → **Shape** → **Inside** in MicroStation.

You are left with a blown up or cropped area of the county map inside your plan sheet that you can now label. Label Map accordingly. If you brought the map in at a scale of 1, then an appropriate text size for labels will be 16 and the weight should be 5 or refer to [Appendix D Section D.5](#) for Standard Text Sizes.

---

## 3.5 General Notes

---

The creation of the General Notes sheet has been automated with a macro named gnote.ba. This macro (program) uses the cell library lgennote.cel, which contains the cells of all standard notes. These notes are called in and placed on the design file with the program calculating the spacing automatically. All standard general notes can be generated using this program. All non-standard notes will have to be added by the CADD operator using the MicroStation text commands.

The following instructions are for creating a General Notes Sheet and applies to both English and Metric projects. (**BOLD** type denotes user key-ins and italics denote menu item selections.)

### 3.5.1 Create a new General Notes Sheet

#### 3.5.1.1 Create a new file in Falcon

Please see [Falcon Instructions](#), for the proper method of creating new design file.

Select the proper Seed file (VDOTSEED.DGN for Imperial or Metric projects)

#### 3.5.1.2 Access the general note macro

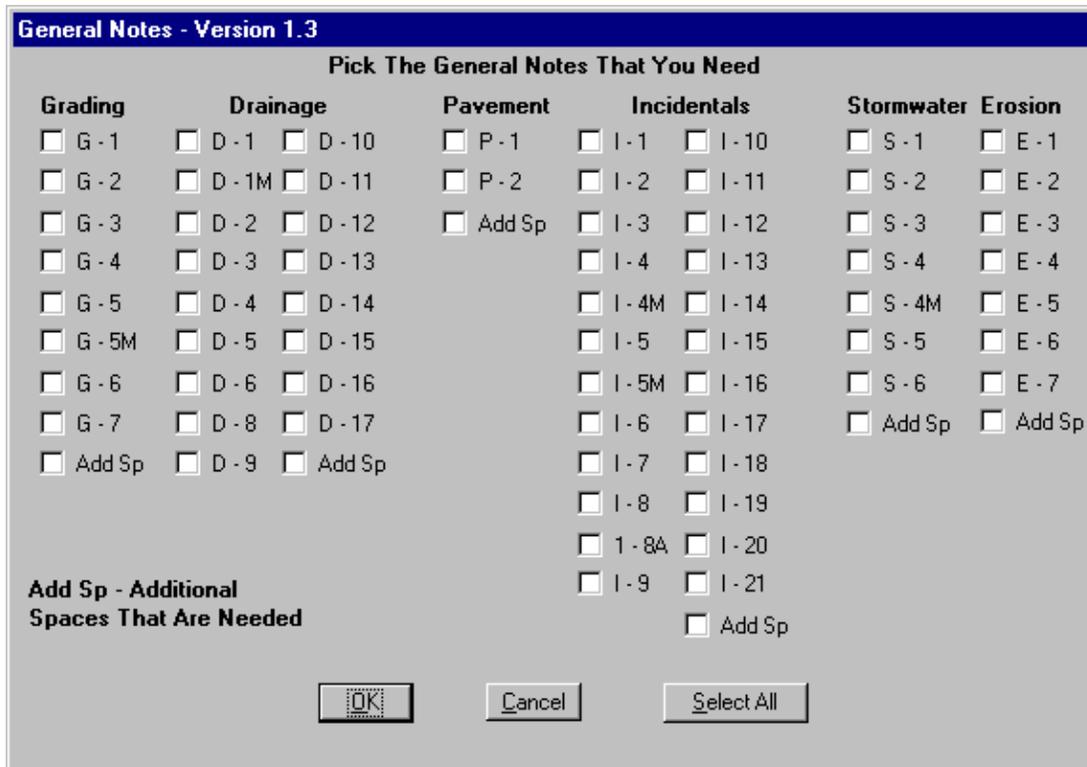

In the MicroStation key-in window, type “**macro gnote**”, and then hit enter or click on the run key-in icon button.

Please see instructions for using Gnote Macro below.

#### 3.5.1.3 Instructions for Labeling General Notes Plan Sheet using macro

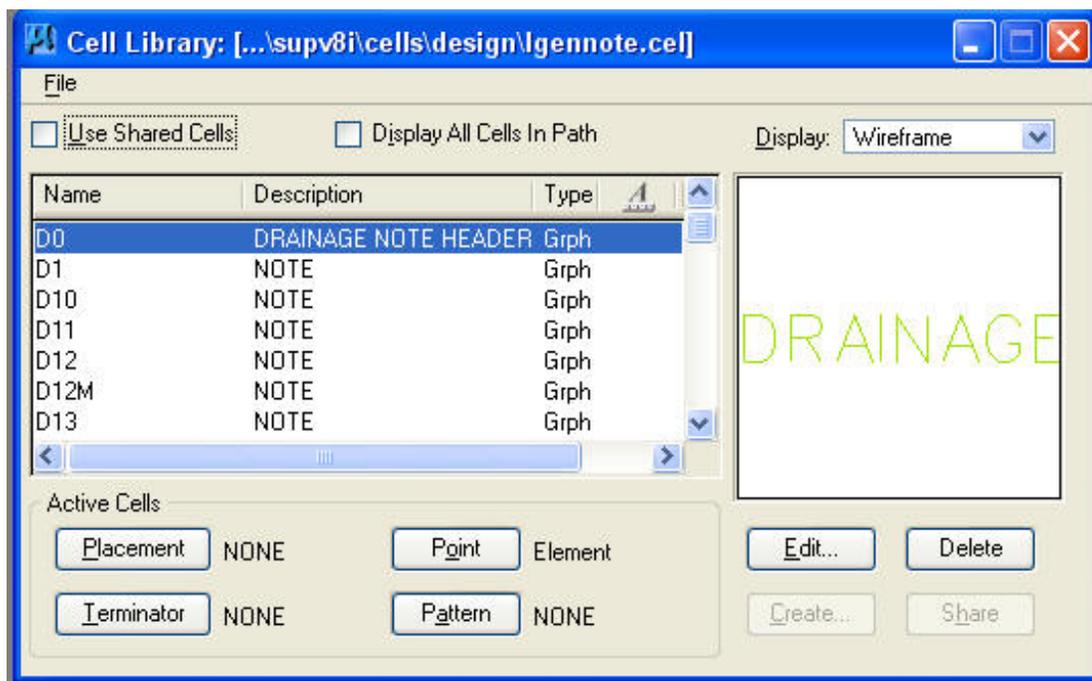

**STEP 1.** Create a general note plan sheet file by creating a file in MicroStation using the **VDOTSEED.DGN** seed file. The **LGNOTE.CEL** which contains the general notes cells is part of the workspace search list for MicroStation cell library. In the key-in windows, type **macro gnote**. This will start a MicroStation macro command, which will prompt you for information about your plan sheet.

The following dialog box will appear:

**STEP 2.** Select which notes you need or you can click on the **Select All** button, and then deselect the ones that you do not need. The **Add Sp** button will prompt you for additional spaces that you may need between each note header.

### 3.5.1.4 Access the general note cell library

### 3.5.1.5 Contents of General Notes Sheet

- Drainage
- Erosion and Sediment Control (ESC)
- Grading
- Incidentals
- Pavement
- Stormwater Management

### 3.5.1.6 Add any special or non-standard notes

Add any special or non-standard notes as needed using the **Place Text** tool from the Main tool palette.

### 3.5.1.7 Complete the sheet title block

Place Plan sheet cell at a scale of ! in the appropriate location to encompass the general notes text. Complete the sheet title block by placing all pertinent information such as project number, Designer, etc. using the **Place Text** command from the main tool palette.

The Policies & Procedures Section will inform the CADD Support Group to update the general note cell library each time the notes are revised. However, the sheets previously created **will not update automatically**. It is the responsibility of the Project Manager or Engineer to revise any general notes sheet created previously, for this reason it is advised that the general notes sheet be reviewed prior to submitting at project milestones to ensure the latest version of the general notes is being used by checking the Cell Library in MicroStation.

If typical sections are to be placed on the general notes sheet, the typical section cells and/or notes must be scaled up to match the scale of the general notes. For example, the general notes sheet is 1"=100' and the typical sections are 1"=5'. The scale difference is a factor of 20 (100/5=20). Set the active scale to 20 before attaching the typical section cells by keying in AS=20.

---

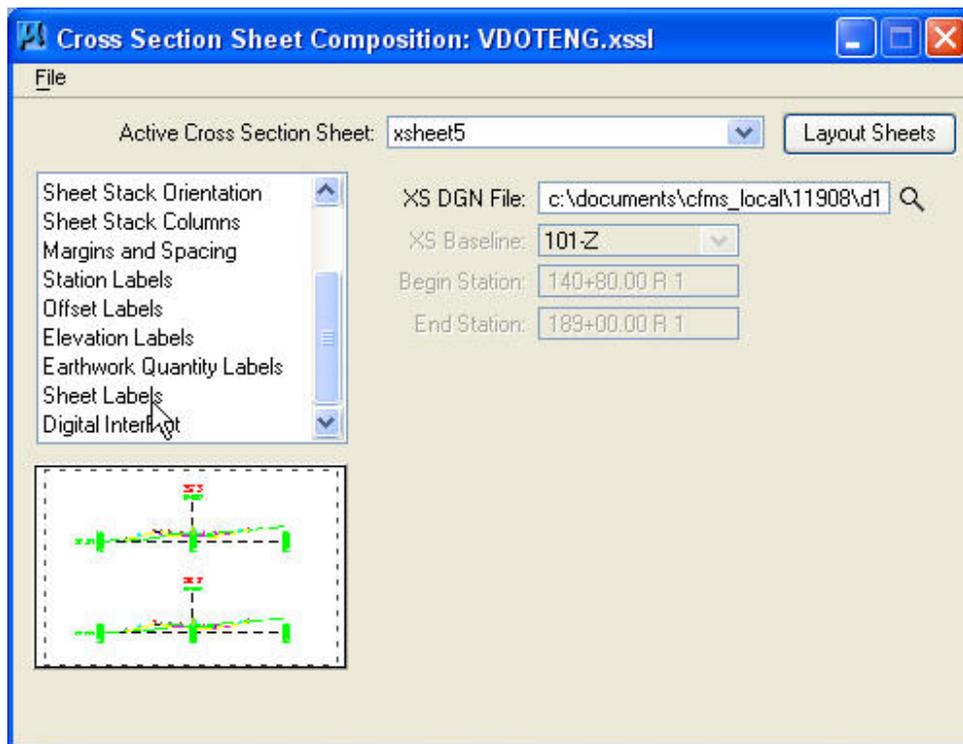

## 3.6 Cross Section Labeling

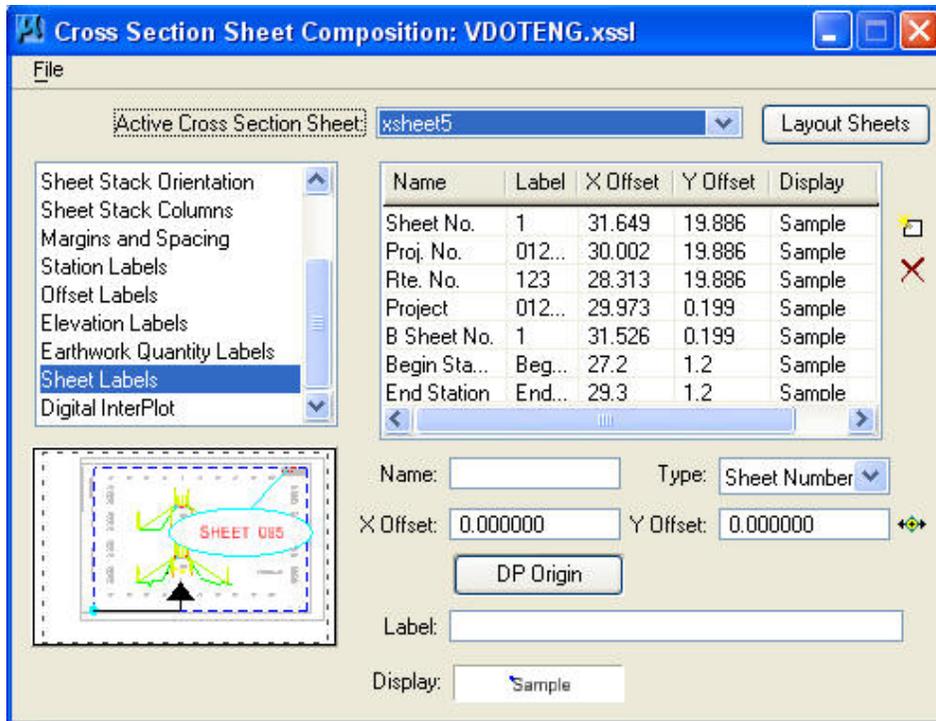

---

### 3.6.1 Instructions for Labeling Cross Section Plan Sheets

Cross section labeling is done with the **Geopak Cross Sheet Layout Tool**.

- Open the Cross Section Sheet Composition dialog box as shown below.
- Scroll down to **Sheet Labels**. In this area of the application, users can type in the Project Number and Route Number that is to be placed on each cross section sheet.
- Double click under the **Label** column where it reads "**0123-015-105, C501**" and type in the Project Number to be placed at the top right corner of the cross section sheet.
- Double click under the **Label** column where it reads "**123**" and type in the Route Number to be placed at the top right corner of the cross section sheet.
- Double click under the **Label** column where it reads "**0123-015-105**" and type in the Project Number to be placed at the bottom right corner of the cross section sheet. These columns widths can be adjusted by clicking the vertical line separator and sliding sideways.
- By default the Sheet No. numbering starts with "1". This field can be modified also.
- Once all the pertinent information is type in the user can click on the **Layout Sheets** button and process the sheets.

### 3.6.2 Examples of Cross Section Labeling

DESIGN FEATURES RELATING TO CONSTRUCTION OR TO REGULATION AND CONTROL OF TRAFFIC MAY BE SUBJECT TO CHANGE AS DEEMED NECESSARY BY THE DEPARTMENT	ROUTE	STATE		SHEET NO.
		STATE	PROJECT	
	123	VA.	0123-015-105, C-501	1
				2717
				2715

			2025
			2010
			2025
	Station 200+00.00 To Station 200+25.00		
59		PROJECT	SHEET NO.
		0123-015-105	1

---

## 3.8 Roadway Typical Sections

---

Typical sections have been standardized for statewide use on all right of way and construction projects. The standards consist of seven different typical sections, which will fit most any roadway designed by VDOT. These sections are stored as cells located in the master state cell libraries `\\coapp52\proj\supv8\cells\design\stdtyp95.cel` for English projects and `\\coapp52\proj\supv8\cells\mdesign\mstdtyp95.cel` for Metric projects.

**DO NOT MODIFY THESE CELLS UNLESS APPROVED BY THE CADD MANAGER.**

The format as established in the typical sections should always be adhered to. However, the typical sections can be modified to meet project needs once they have been placed in the design file.

### 3.8.1 Changes Allowed in Typical Sections

- Widths of pavement
- Slopes, if different from standards
- Adding median, traffic barriers, etc
- Adding topsoil, seeding, etc.
- Adding appropriate typical section names and stations

### 3.8.2 Typical Section Sheet in Falcon

#### 3.8.2.1 Create a new file

Please see [Falcon Instructions](#), for the proper method of creating new design file. Select the proper Seed file (**VDOTSEED.DGN** for Imperial projects and **MSEEDTYP.DGN** for Metric projects) The user will have to place the appropriate plan sheet cell in the design file for imperial projects but the design file for metric projects will have a blank plan sheet in it.

#### 3.8.2.2 Fill in all pertinent information

Fill in all pertinent information such as project number, sheet number, route, Project Manager, Surveyor, Design Supervisor, Designer, etc.

#### 3.8.2.3 Place appropriate cell(s)

Place appropriate cell(s) from the Cell Library to create typical sections as required, including blowups and pavement patterns.

NOTE: Examples of all typical section cells and text needed to create the typical section sheets are shown below and in [Appendix C](#) of this manual.

---

## 3.9 Roadway Design for Total CADD

---

### 3.9.1 Development of Plans

After notification of completed survey from State Survey Parties Engineer, the Project Manager will request that preliminary design development begin. The letter notifying the engineer of the completed survey will include both project file name and design scale. The steps involved in the preliminary design development are outlined below. If no additional location studies are necessary, plans for a Preliminary Field Inspection can begin. The required plan work involved for the **Preliminary Field Inspection (PFI)**, **Public Hearing (PH)**, **Field Inspection (FI)**, **Right of Way (RW)** and **Final Submission (FS)** milestones of the project are outlined in the [Electronic Plan Submission Process Flow Chart](#) and will be checked in accordance with the [Quality Control Checklist](#). Plan Rolls and Profile Rolls, in lieu of plan and profile sheets, are acceptable for the PFI and PH Stages, unless the Project Manager would prefer plan and profile sheets be prepared for those stages.

#### 3.9.1.1 Create the master design file

Create the master design file with naming convention in accordance with [Chapter 3 Section 1](#). No sheet number is required since this will be the master file.

DIVISION + UPC # + DESIGNATED USE + EXTENSION

Example: d3850des.dgn

#### 3.9.1.2 Attach Cell Libraries

The **dsymgeo.cel** and **mdsymgeo.cel** cell libraries are now legacy cells. After 2014 and with the addition of MicroStation/OpenRoads we use **dsymgeo2015.cel**. for Design creation. For more information, see “Cells” in [MicroStation/OpenRoads Standards 2016](#). If you are using **GEOPAK** then the **Design Computation Manager** Tool Box is preferred. If GEOPAK is not used, then attach **dsymgeo.cel** library for imperial projects or **mdsymgeo.cel** library for metric projects.

Workspace Configurations in MicroStation have been setup by VDOT’s CADD Support Section to defined paths to folders where cell libraries are located. When the user opens the cell library dialog box and clicks on “**File**” a list of the cell libraries is displayed. The user can pick the appropriate cell library.

The above cells are found in [Appendix D, Section 8](#) of this manual.

**NOTE:** Set active scale based on the project scale.

Example: AS=0.25 for 25 scale Imperial plan or 250 scale Metric plan.

### 3.9.1.3 Keep Master Design files intact

Keep the master design files intact as your "roadway design files" for inputting **all** roadway design items throughout the life of the project. Do not place design items or annotation for design items in the individual sheet files. However, place notes, special symbols, reference notations, and symbol legends can be placed in sheet files.

This master design file will have the survey file referenced to it. This master survey file will initially be unlocked so that the designers can move text that overlaps their design. When updating the master survey file, lock the original survey file, thus preventing the designer from moving the text.

**NOTE: DO NOT COPY the locked Survey File to a new file and make changes to the new file. It creates a situation where the Designer's changes will be lost when the Survey Master File is updated and unlocked.** Reference all other necessary files at this time also.

When submittal of the plans is necessary, the master file can be clip-bound into the sheet files for plotting. Create the actual plan sheets using the clip bound method at the appropriate stage of development and will be addressed later in this chapter. Multiple users can use the master design file, though **close coordination between the various files is critical**. When several users need to develop their design in the master file, the only way to accommodate this is to reference the master file to several other design files. Copy each **uniquely named design file** later into the master file before submittals. For example, an engineer may want to divide a three-mile project into three separate one-mile segments. Each segment will reference the master design file. CADD operators can work concurrently on their segment of the project at submittal stages. The master design file can be loaded into MicroStation and each segment referenced and copied into it. When you copy the segments back into the master file, delete the segment files.

**It is critical that each segment file have a unique file name.** Add a qualifier to the end of the filename, i.e., **a** or **a 1** (d3850desa.dgn or d3850des1.dgn).

### 3.9.2 Alignments

Enter all alignments for **new projects** using the Departments current automated engineering design package GEOPAK.

See [GEOPAK Training Manuals](#) Cogo Geometry Section 3-2 for details.

## **3.9.3 CADD Development**

### **3.9.3.1 Use of Levels, Weights, Line Codes, and Colors**

Place all lines, cells or other graphic elements necessary to illustrate the design in the design file in accordance with the current level structure as detailed in [Appendix D Section 4](#) of this manual. Place all proposed items in the file using the proper levels, line weights, line codes, and colors as established by the Standards Committee. The use of the Quantity Input tool D&C Manager (GEOPAK) will assure that all items are in accordance with those standards. Details of these standards are in [Appendix D](#) of this manual. The D&C Manager is located under Applications, GEOPAK Road Tools in the pulldown menu in MicroStation or in Main Tool Box of Task Manager.

NOTE: Electronic files are available to contractors for projects designed on CADD and located in Falcon. The need for placing items on proper levels is of utmost importance, See [Appendix D, Section 4.2](#).

### **3.9.3.2 Annotation Instructions**

#### **3.9.3.2.1 Proposed Work**

Annotate all proposed work on projects in lieu of designations that require legends for explanations. When possible, label each continuous proposed work item once at each side of the roadway per plan sheet. This will decrease the amount of plan clutter. See [Using the Place Note Command](#) document for annotating with leader lines and terminators or use the Plan View Labeling tool in GEOPAK See [Appendix D Section 5](#) of this manual for text sizes and weights.

#### **3.9.3.2.2 Use of Legends**

Complex projects that involve dense topography and proposed work will require the use of special legends. These legends must incorporate the standard symbols as specified in the [Road Design Manual](#). Designer must review all legends for consistency with the plans.

#### **3.9.3.2.3 Standard Symbols**

Some construction items incorporate standard symbols in lieu of labeling. These symbols are included in a legend at the bottom of the plan sheet. Erosion control items, construction limits, and crosshatching for demolition of pavement are examples of such symbols.

#### **3.9.3.2.4 Use of "Proposed" and "Required"**

The term "Proposed" applies to roadways, lanes, interchanges and other items that are not construction items in the contract. The term "Required" applies to all paid items that the contractor is constructing.

### 3.9.3.2.5 Labeling Alignments

Label all field survey lines "Survey Baseline." Label the alignment used to build the road "Construction Baseline." If you create an office-revised line for obtaining survey, but do not use it for construction, label it "Office Revised Baseline."

### 3.9.3.2.6 Dimensioning

When dimensioning such items as existing right of way, proposed pavement, medians, etc., which are consistent throughout a plan sheet only need to be dimensioned once on each sheet. However, in areas where there are median breaks, intersections and other configurations, additional dimensioning may be required.

### 3.9.3.2.7 Arrows on Power Poles

The arrows indicating that power poles are within the construction limits are no longer required on the plans if the poles are not to be relocated.

### 3.9.3.2.8 Utility Data

On projects that have an Underground Utilities Test Hole Information Sheet, the utility owners name, address and phone number are to be shown on the sheet, and only the utility owners name should appear on the plan sheet. Projects with minimal utility involvement and without a utility data sheet will continue to list all information on each plan sheet. Access the Test Hole Information Sheet as a cell in the Sheet 2000.cel library.

### 3.9.3.2.9 Unapproved Stamps

Place the following note in each sheet design file prior to approval for Right of Way. This note can be found in the dsymgeo.cel and mdsymgeo.cel, library (AC=UNRWC).

**"THESE PLANS ARE UNFINISHED AND UNAPPROVED AND ARE NOT TO BE USED FOR ANY TYPE OF CONSTRUCTION OR THE ACQUISITION OF RIGHT OF WAY."**

### 3.9.3.3 Plots for PFI Meeting

The Lead Design Engineer is to check with the Project Manager for the roll or plan assembly and scale size required for the PFI Meeting. [See Appendix G](#) for complete instructions Preliminary Field Inspection.

### 3.9.3.4 Use of CADConform Software

Use CADConform to check the validity of items in the Master DGN files. It is recommended that all files be scanned at each milestones of project development. Maintain reports generated by the scanning and checking of files in the project directory through Falcon DocMan

### 3.9.3.5 Pattern Reference File

Perform all necessary pavement stippling and demolition of pavement cross-hatching in a design UPC#.pat file. Reference the UPC#.pat file into the sheet design files in accordance with instructions in [Appendix D Section 2](#) of this manual.

### 3.9.3.6 Requesting a merged DTM file

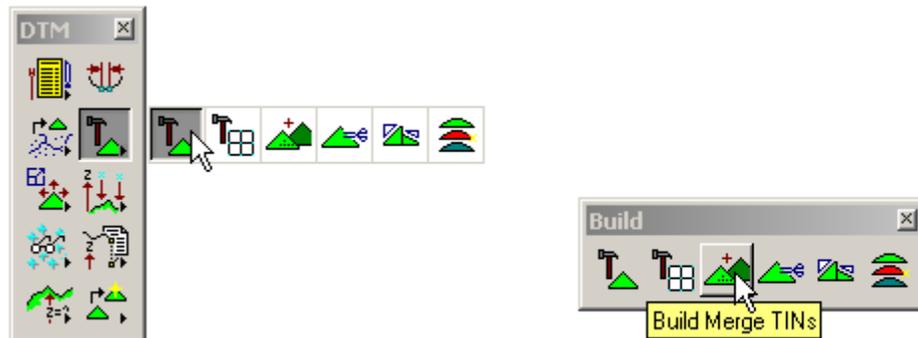

Provide a Tin file containing the proposed and existing surfaces merged together to the Hydraulic Designer when requesting hydraulic design.

For merging surfaces instructions see below:

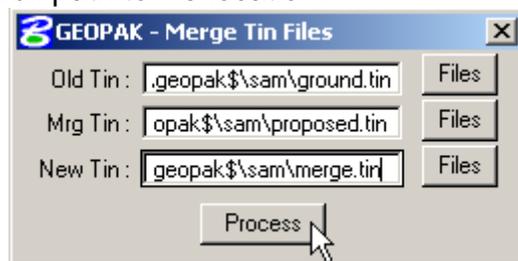

1. Open MicroStation, and then open one of your project files (it does not matter which file, because no data will be placed in file). Make sure GEOPAK is activated, and then use Project Manager to access your project.

2. You will need to have cross sections all ready created for project. Create design surface in accordance with Lab 16 in the GEOPAK Road 1 Course Manual, Section 16.1, steps 3 - 5, 14 – 17, and Section 16.2, steps 1 – 5.
3. Access the merge surfaces tool. From step 2, you should have accessed the DTM Tool pallet. Tear off the Build tool bar, and then click on the third button, Build Merge TIN's.

4. Fill out the dialog box, substituting your file names for the ones shown. Make sure to include full path to file location.

## 3.9.4 Development of Plans for Preliminary Field Inspection

### 3.9.4.1 Incorporate all changes requested from the Preliminary Field Inspection Meeting into the master design file.

### 3.9.4.2 Create Base Plan Sheets

This procedure can be done any time after the Preliminary Field Inspection Meeting review comment(s) have been incorporated into the design file, but is recommended to be done after Public Hearing. Consult the Project Manager prior to the Public Hearing to see if base plan sheets are necessary for that stage. Instructions for GEOPAK projects can be found in your [Road 1 Training manual](#), chapter 18.

1. Create individual files for each sheet in accordance with [Section 1](#) of this chapter.
2. Attach all appropriate survey files as a reference file. See [Falcon Instructions](#), for proper method of attaching reference files.
3. Attach master design file as reference file (preliminary design file). See [Falcon Instructions](#), for proper method of attaching reference files.
4. Place plan sheet in file at an active scale corresponding to the project scale and at the active angle to match the orientation of the project. Attach the proper scale bar for the scale of the project.
5. Key-in:  
AC=PLA  
AC=SBAR# (SBAR1, SBAR25 or SBAR50)
6. Confirm that locate and snap for each reference file is set on.
7. Once the above steps are completed, rotate the view and save the settings for batch plotting the file. **Do not** rotate the file itself. Correct coordinates must be maintained at all times and rotating a reference file will corrupt the coordinates. See [Section 3.11.1](#) for details on MicroStation Print Organizer (Batch plotting). These instructions must be applied to all sheet files to be plotted.
8. Complete data on sheet files such as project numbers, sheet number, Engineer and designers names, etc. All of this data shall be placed on level 61.
9. Perform clip-bound procedure in accordance with instructions in [Appendix D Section 2](#) of this manual.

### 3.9.4.3 Develop Design in Greater Detail

Draft proposed entrances, crossovers and other incidental items that can be added at this time in the master design file.

### 3.9.4.4 Construction Limits

The construction limits are handled by GEOPAK. See [Road 1 Training manual](#), chapter 16 for symbology.

### 3.9.4.5 Intermediate Prints/PDFs

A set of PDF files should be made and kept up to date (current drawings, etc.) to facilitate print on demand capabilities for other Divisions. See [Generating and Submitting PDF Files/Archiving](#) for instructions on creating PDF files.

### 3.9.4.6 Right of Way and Easements

Proposed line work for Right of Way (including Limited Access Lines where applicable), permanent drainage easements, and temporary construction easements necessary for construction will be placed in the master Right of Way design file rUPC#+rw.dgn. Parcel Numbers and Demolition Numbers, as provided by District RW, will be shown in the master design file dUPC#+des.dgn). Utility Easements may not be available until after the Utility Field Inspection is held (after the FI), but these easements will be incorporated into the master Right of Way design file rUPC#+rw.dgn) before submittal of the RW Stage Plans.. See [Chapter 5](#) on Right of Way / Easements and Utilities, for detailed information on the preparation of Right of Way plans.

### 3.9.4.7 Critical Infrastructure Information/Sensitive Security Information (CII/SSI)

A note for Critical Infrastructure Information/Sensitive Security Information has been created. This note will have to be added to the plan sheets that contain Critical and Sensitive information. The note is called “*cii*” and is found in the sheet2000 cell library.

### 3.9.5 Traffic Maintenance Plans (TMP)

TMP Plans should be prepared for Constructability Review Meetings as soon as possible in the early plan development stages, and are required in the FI Plans.

There are several methods of laying out a sequence of construction. Each project is different from every other project in some way. These are two suggestions of methods that can be used as a guide for your particular situation:

#### 3.9.5.1 Method 1

##### Phase I

1. Create a new design file for the sequence of construction sheets. Attach the appropriate Reference Files. See [Falcon Instructions](#), Pages 12 and 13 for proper method of attaching reference files.
2. Make the sheet cells large enough to encompass the area that you want to cover, by changing the active scale.
3. Clip-bound the reference file so that only the area inside the sheet is visible. Turn off desired levels in the reference file to eliminate unnecessary lines and text.

##### Phase II

Use the reference file from Phase I to produce the sheets in Phase II. The proposed elements in Phase I will need to be shown as existing in Phase II. This can be accomplished by using element symbology on Phase I

#### 3.9.5.2 Method 2

##### Phase I

1. Create a new design file for each sequence of construction sheet.
2. Attach the appropriate Reference Files. See [Falcon Instructions](#), Pages 12 and 13 for proper method of attaching reference files.
3. Give each Reference File a UNIQUE logical name.
4. Turn off undesired levels to eliminate unnecessary lines and text. Copy appropriate elements into new design file and make adjustments.

##### Phase II

1. Use the design files from Phase I to produce the files in Phase II.
2. Copy appropriate elements into new design file, make adjustments and show proposed items in Phase I as existing in Phase II.
3. If you need to insert additional elements, attach the same Reference File(s) as in Phase I.
4. Repeat the above procedure for each Phase, as appropriate.

### 3.9.6 Develop Plans for Public Hearing

1. Incorporate all changes requested from the Preliminary Field Inspection Meeting in the master design file.
2. Make necessary additions and/or modifications as described below for color plots for Public Hearing if desired

#### 3.9.6.1 General Guidelines for Public Hearing Plans Assembly

1. MicroStation limits vertices to 5000 for a shape
2. Line Weight for shapes should be 0 (zero)
3. Shapes should be placed with Fill Type set to Opaque
4. Fill option needs to be turned on in the View Attributes dialog box

**Create all Public Hearing Displays in accordance with information provided in**

**[Appendix G](#) of this manual.**

### 3.9.7 Develop Plans for Right of Way

1. Make any changes to plans necessary as a result of the comments from the Public Hearing, Field Inspection and Utility Field Inspection Meetings.
2. Remove "unapproved note" (UNRWC) and replace it with the following note in each sheet design file. This note can be found in the dsym.cel and mdsym.cel, library (AC=UNCONS).

**"THESE PLANS ARE UNFINISHED AND ARE NOT TO BE USED FOR ANY TYPE OF CONSTRUCTION."**

3. Update PDF files and Archive Project. See [Generating and Submitting PDF Files/Archiving](#) for instructions.

See [Chapter 5](#) on Right of Way / Easements and Utilities, for detailed information on the preparation of Right of Way plans.

### 3.9.8 Develop Plans for Final Submittal

1. Complete any design details or changes in the master design file. Revise Plans as necessary for any Right of Way Revisions required. Follow the [Electronic Plan Submission Process Flow Chart](#) and the [Quality Control Checklist](#) PAC column checklist requirements when completing plan assembly and plan summaries.

#### 3.9.8.1 Digitized Signatures

1. In accordance with Mr. J. S. Hodge's memorandum dated April 19, 1991, it is satisfactory to use digitized signatures on revised title sheets. The FHWA requires that plans be signed when they are submitted for PS&E. Possible future litigation requiring the testimony of the signatories necessitates the requirement of retaining the original signed title sheet. Therefore, the original signed title sheet **MUST NOT** be destroyed. To use digitized signatures, the sheet will have to be scanned. The scanned signatures can only be used on the project to which the original signatures apply. See [Digital Signature Instructions](#).
2. Remove all "**NOT INTENDED FOR CONSTRUCTION**", notes prior to submitting for Plan Coordination Review. (After PAC comments have been made and prior to First Submission to Programming and Scheduling Division).
3. Submit electronic files (PDF's) for Plan Coordination Review to Construction Division for **Tier 2** Projects only.
4. For additional information on **Tier1** and **Tier 2** project criteria, see [IIM-LD-249](#).

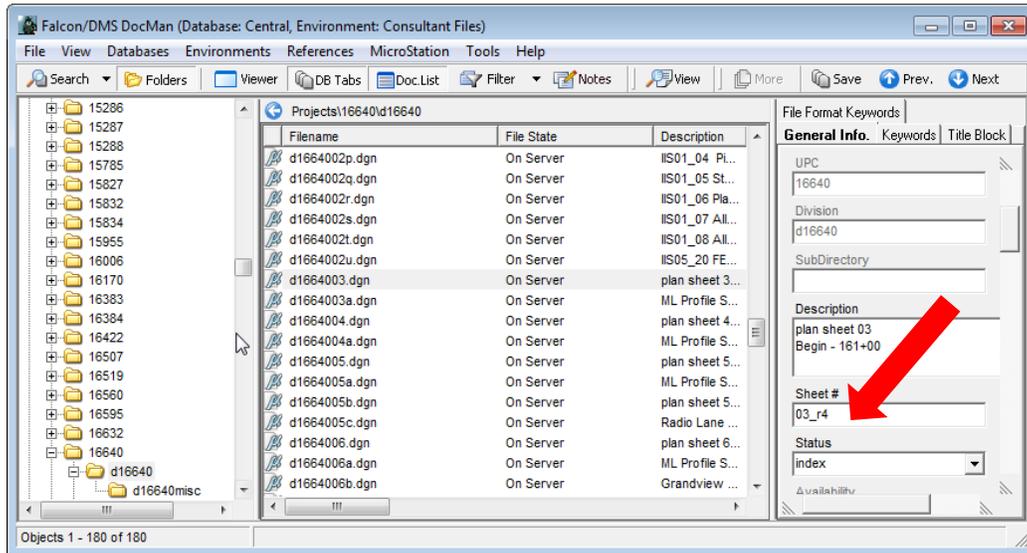

#### 3.9.8.2 Review

1. See: [Electronic Plan Submission Process Flow Chart](#) for overview of all submission procedures.
2. See [Electronic Plan Coordination Review](#) for revised instructions. Verification of the usage of proper levels **MUST BE** checked at this stage.
3. After all changes are made as a result of the Plan Coordination Review, see [Electronic Advertisement Submission](#) instructions.

### 3.9.9 Revisions after R/W or Final Submittal

VDOT has instituted a new policy so that revisions are not overwriting original plan sheets but are saved as **Revisions**. When changes are made to Right of Way after R/W Acquisition Plan Stage it is now a requirement that all changes made are noted as **REVISIONS** and follow the procedures outlined below. Construction Revisions will continue to be done the same as in the past.

When making a Right of Way revision, make the changes in the appropriate Microstation file or files. Then change the Sheet # field in the Falcon database by adding a \_r1, \_r2, \_r3 etc. to each sheet. **For example: #3\_r4 and #5\_r4 means that sheets 3 and 5 are a part of (R4) (revision no. 4) as denoted on the Revision Data Sheet\***

Then change the **Generate PDF** database field to **CURRENT DRAWINGS** for all the sheets that are to be included in the revision. The MicroStation files are now ready for PDF files to be generated and submitted to Falcon.

*Note: The pick list has been updated to remove Right of Way and Right of Way revision.*

\* Rev 3/17

When a formal Right of Way revision is ready to be processed, an email request is to be sent to the CADDSupport Helpdesk along with a copy of the LD-36 requesting the PDF files be updated in Current Drawings and a copy of the revised files for the formal revision be placed in the Right of Way Plan Room of Falcon.\* The old files will be moved to a **void folder** under the project folder in the Right of Way plan file room. The UPC number will be removed by CADDSupport from the Falcon database field so that the void files no longer show up on Falcon Web. Revised files will be added to the Right of Way plan file room and will now show up on Falcon Web. For more information see the [Road Design Manual Section 2F-5](#) and the [Electronic Plan Submission Process Flow Chart](#).

Consultants will submit pdf files named in accordance with [Chapter 1 Section 1.4.3](#) in the CADD Manual.

For information on revised plans in the Plan File Room, see [Chapter 1 Section 1.5](#).

---

\* Rev 3/17

---

## **3.10 Standards/Special Design Section**

---

The Standards/Special Design Section of Location and Design is responsible for all of the standard drawings shown in the Road Design Standards Imperial and Metric Manuals, and for the Insertable Sheet updates for those Standards. They also prepare Special Design Detail Sheets for project specific situations when modifications to Standard details are necessary.

### **3.10.1 CADD Drawing Standards (Imperial) MicroStation**

Working units are located in the "settings menu". All drawings in the Standards/Special Design Section are to be drawn at a scale ratio of 1:1000 (i.e.; 1-foot equals 1000 feet). Therefore, each drawing's settings must be set as follows:

#### **3.10.1.1 Imperial Working Units**

Master units:	ft
Sub units:	th
1000:	th per ft
1:	pos units per ft
Working Area (each axis):	170,591,236 miles

#### **3.10.1.2 Coordinate Readout**

Format: master units  
Accuracy: 0.1234

#### **3.10.1.3 Angles**

Format: DD.DDDD  
Mode: Conventional  
Accuracy: 0.1234

**3.10.1.4 Standard Levels, Weights and Text Size for all Drawings prepared by the Standards/Special Design Section (Only)**

<b>LEVEL 1</b>	<b>Dimensions, extension, hidden, centerline and terminators.</b>	
	<b>Half or Full Size Sheet</b>	8.5" x 11"
	<b>Imperial</b>	
	WT=1	WT=1
	CO=0	CO=0
	Line terminator CO=200	Line terminator CO=200
<b>LEVEL 2</b>	<b>Object elements (lines, circles, charts, etc.)</b>	
	<b>Half or Full Size Sheet</b>	8.5 x 11
	<b>Imperial</b>	
	WT=2	WT=2
	CO=2	CO=2
<b>LEVEL 3</b>	<b>Dimension text (over all text).</b>	
	<b>Half or Full Size Sheet</b>	8.5" x 11"
	<b>Imperial</b>	
	WT=3	WT=1
	CO=1	CO=1
	TX=12.5	TX=12.5
	LS=6.25	LS=6.25

<b>LEVEL 4</b>	<b>Reinforcing steel rods.</b>	
	<b>Half or Full Size Sheet</b>	8.5" x 11"
	<b>Imperial</b>	
	WT=4	WT=4
	CO=3	CO=3
<b>LEVEL 5</b>	<b>Section text (Section A, Detail A, etc.).</b>	
	<b>Half or Full Size Sheet</b>	8.5" x 11"
	<b>Imperial</b>	
	WT=5	WT=3
	CO=5	CO=5
	TX=19.5	TX=19.5
	LS=9.75	LS=9.75
<b>LEVEL 6</b>	<b>Title block text.</b>	
	<b>Half or Full Size Sheet</b>	8.5" x 11"
	<b>Imperial</b>	
	WT=6	WT=4
	CO=5	CO=5
	TX=29	TX=29
	LS=14.5	LS=14.5
<b>LEVEL 7</b>	<b>Cells and patterning unless otherwise assigned a level. (CO=0, WT=0)</b>	
<b>LEVEL 60 &amp; 61</b>	<b>Borders for plan sheets, Road Design Manual, I &amp; I Manual, BRGR and Road &amp; Bridge Standards (cells).</b>	

All text should be placed using font 1 (FT=1) and at active angle of 0 (AA=0).

### 3.10.1.5 Insertable Sheets

The creation and maintenance of all insertable sheets is the responsibility of the Standards/Special Design Section, in cooperation with the CADD Support Group. Notice of the Electronic distribution of Insertable Sheet updates will be the responsibility of the Standards/Special Design Section.

All insertable sheets are used as reference files. See [Instructions for using Falcon V6](#) for steps on referencing files. To find appropriate file to reference, set your UPC# to Eng\_ser, then set Division to insert (Imperial) or minsert (Metric); scroll through the list to find file.

Prior to submission for construction (PAC), the insertable sheets for your project should be copied into the appropriate design file with the **exception** of the Right of Way Data sheet (a9.dgn). This sheet should be copied into the appropriate design file at the Right of Way stage.

### 3.10.2 Revisions to Insertable Sheets

If the insertable sheets are revised by the **Standards/Special Design Section**, a new set of files along with a text file explaining the revisions will be sent to the District CADD Analyst. The CADD Analyst in the district and the support group in the central office should notify the designers that a revision is forthcoming and the date it will be loaded on the system. This notification should also explain what the revisions are.

The designer must then determine if he needs to keep the old insertable sheet for his particular project or if he needs to use the revised sheet. If he wants the revised sheet, it will appear automatically. If he needs to keep the old sheet, he will have to copy it into the design file prior to the new sheets being loaded on the system.

**DO NOT CHANGE THE BASE CONTENT OF THE INSERTABLE SHEET WITHOUT PERMISSION FROM THE POLICIES & PROCEDURES SECTION.**

### 3.10.3 Referencing PDF insertable sheets to a MicroStation V8i file

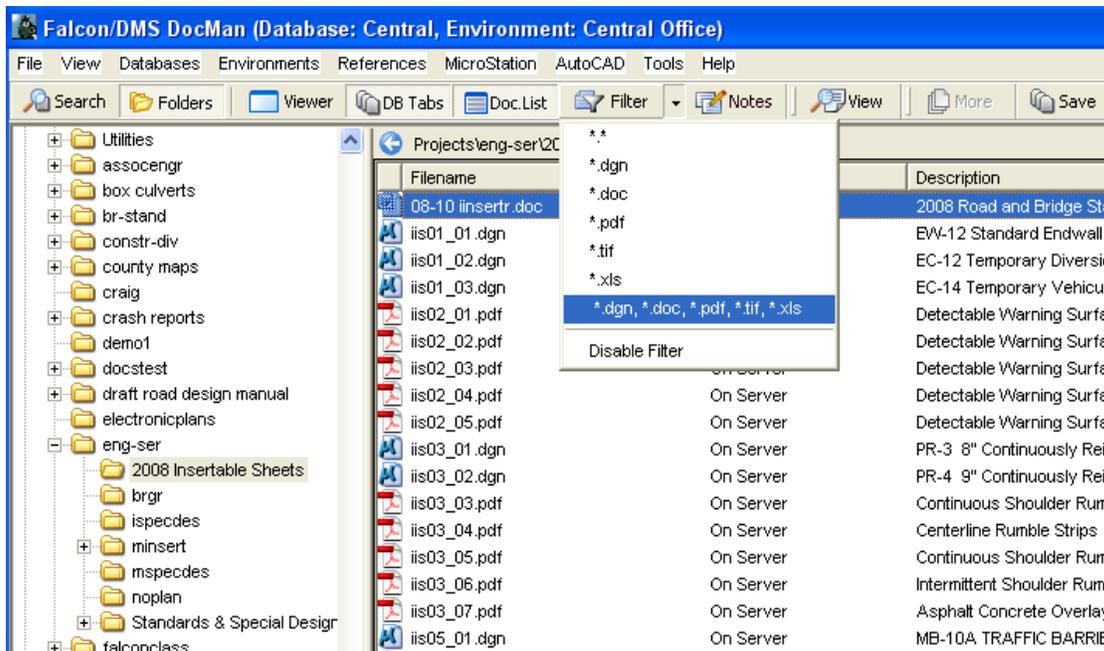

With the upgrade to MicroStation V8i we now have the ability to reference adobe PDF files in lieu of embedding tiff images. This will allow the sheets to print correctly from MicroStation V8i.

The following insertable sheets are in PDF format only and will need to be referenced as a raster file to a MicroStation file when the specific standard is required for a project:

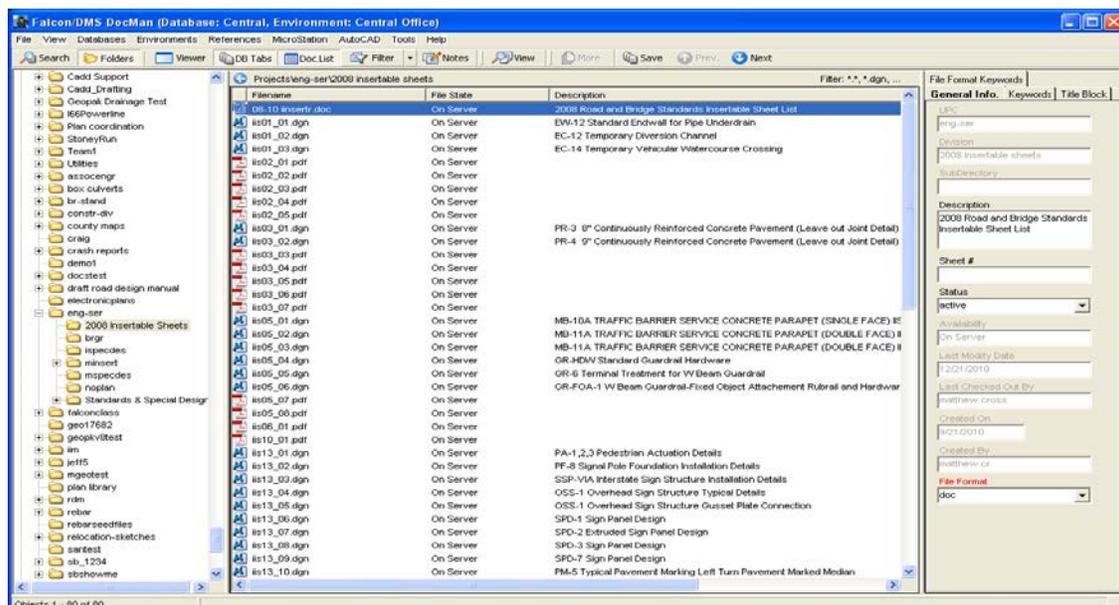

Insertable Sheets that are in PDF format only		
IIS01_04	IIS05_05	IIS10_01
IIS02_01 thru IIS02_05	IIS05_07 thru IIS05_20	
IIS03_03 thru IIS03_07	IIS06_01	

### 3.10.3.1 Instructions for referencing PDF insertable sheets to a MicroStation file:

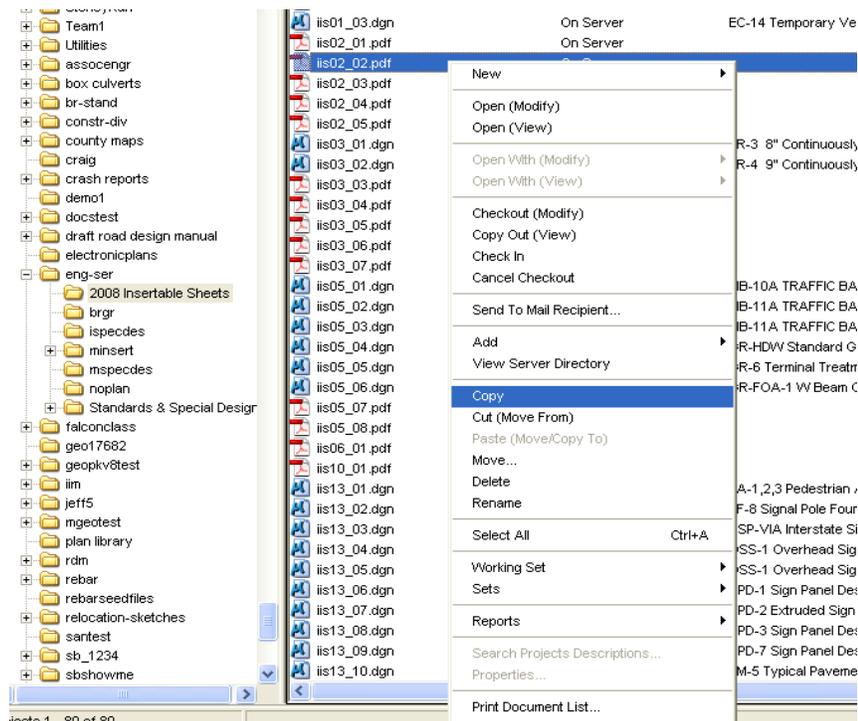

1. Go to the eng-ser directory in Falcon DocMan (be sure that the Database: Central, Richmond, Bristol, Nova... is set to the same database that your project is in) and make sure your filter is set so that you can see both dgn files and PDF files.

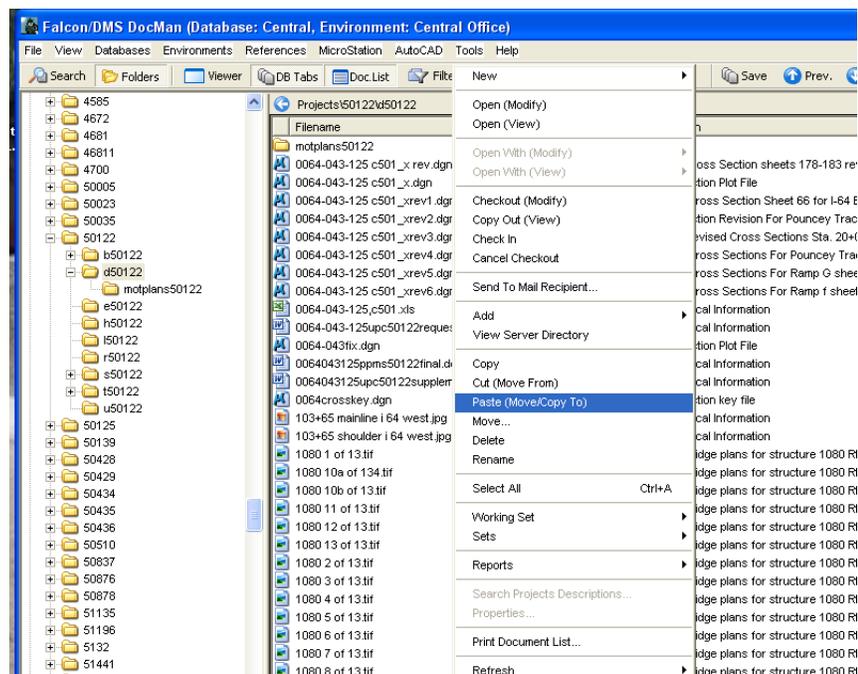

2. The highlighted word document contains a listing and description for all insertable sheets

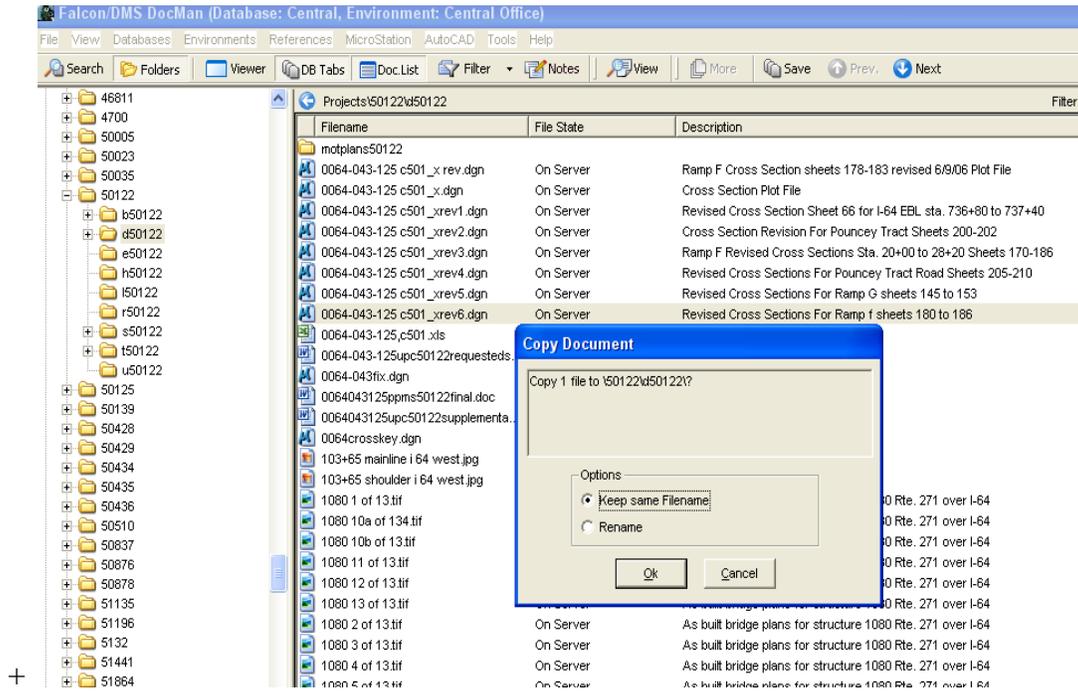

- Copy the PDF insertable sheet files from the eng-ser directory to your design directory. **Do not** reference the PDF insertable sheet from the eng-ser directory.

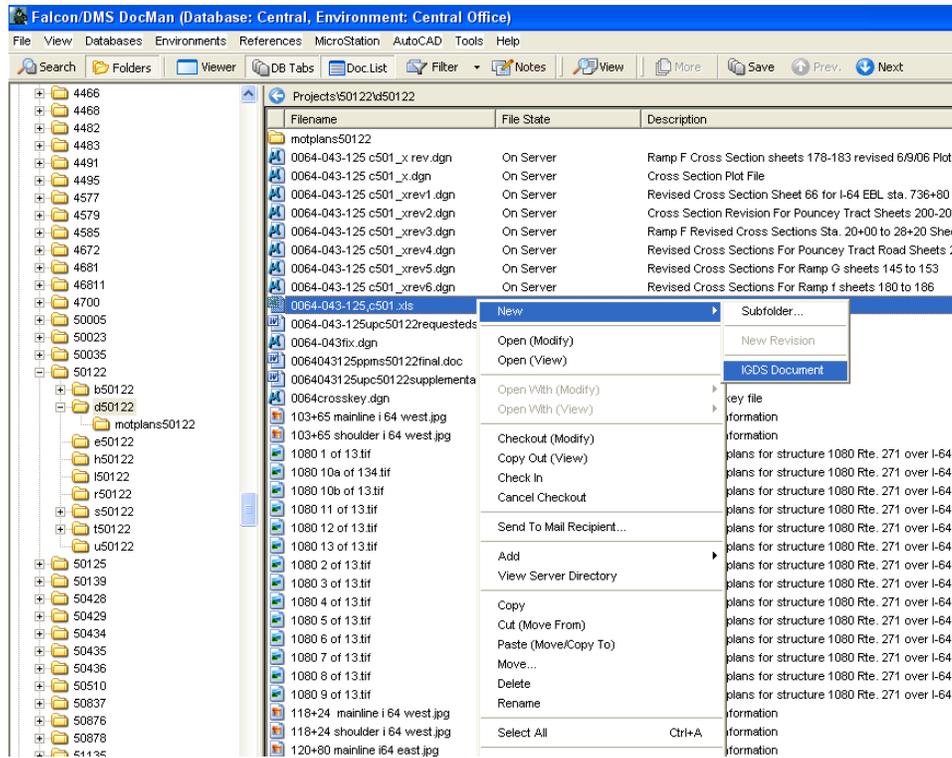

- Navigate to the design directory and paste the applicable PDF file.

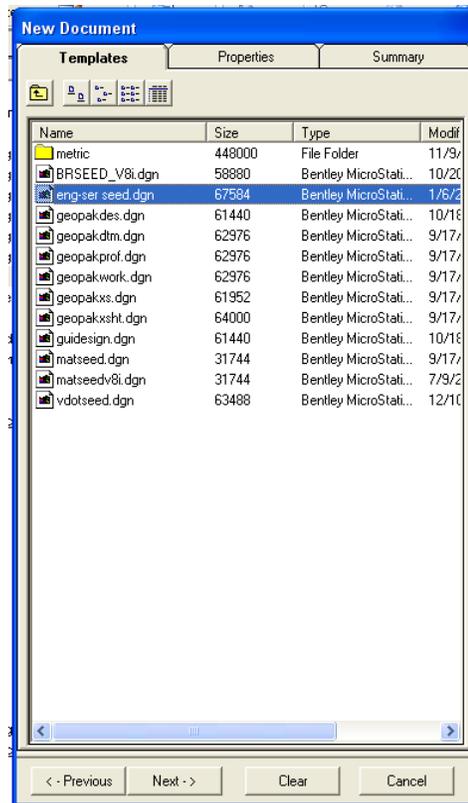

- You want to retain the same filename so when prompted click Ok to Keep Same Filename.

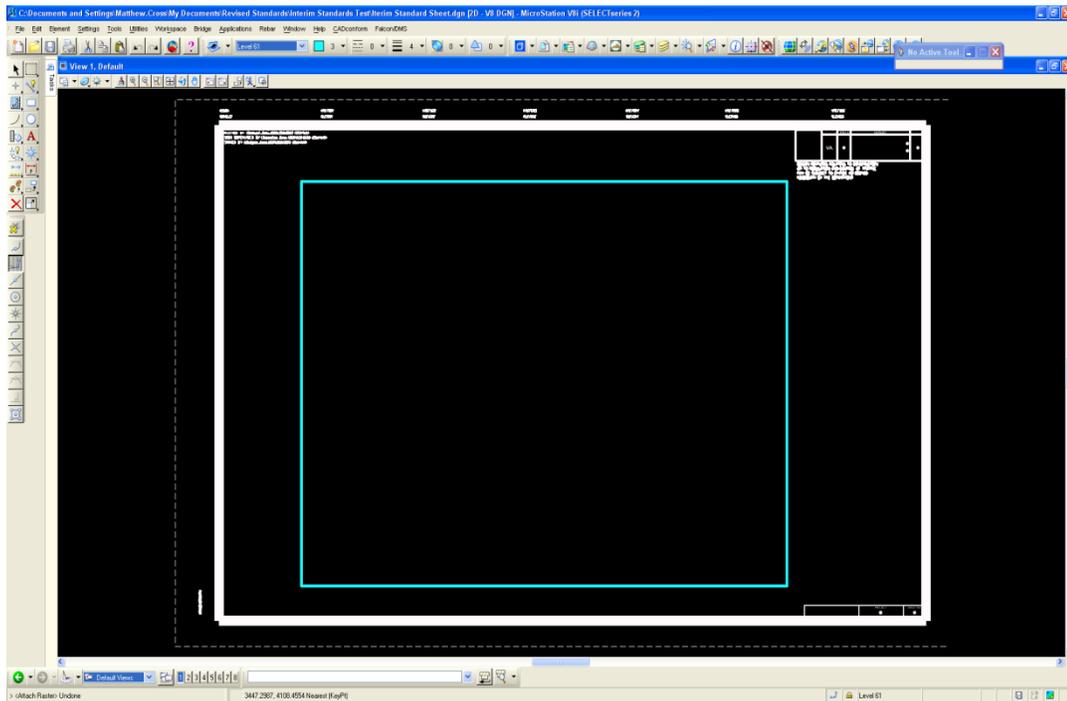

- In your project directory, create a **NEW** file using the eng-ser seed.dgn file.

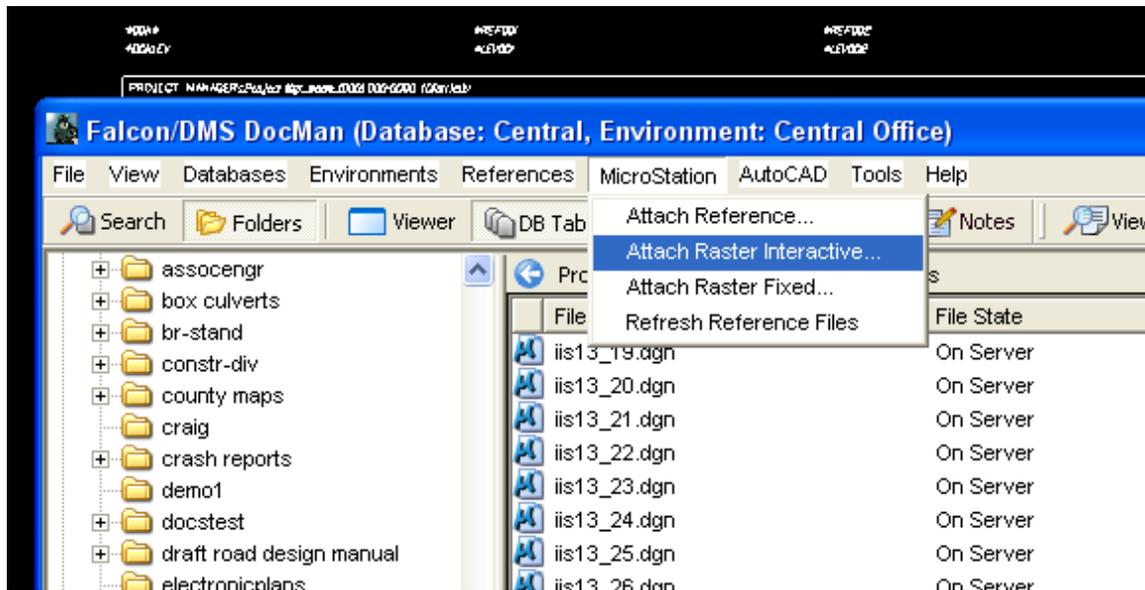

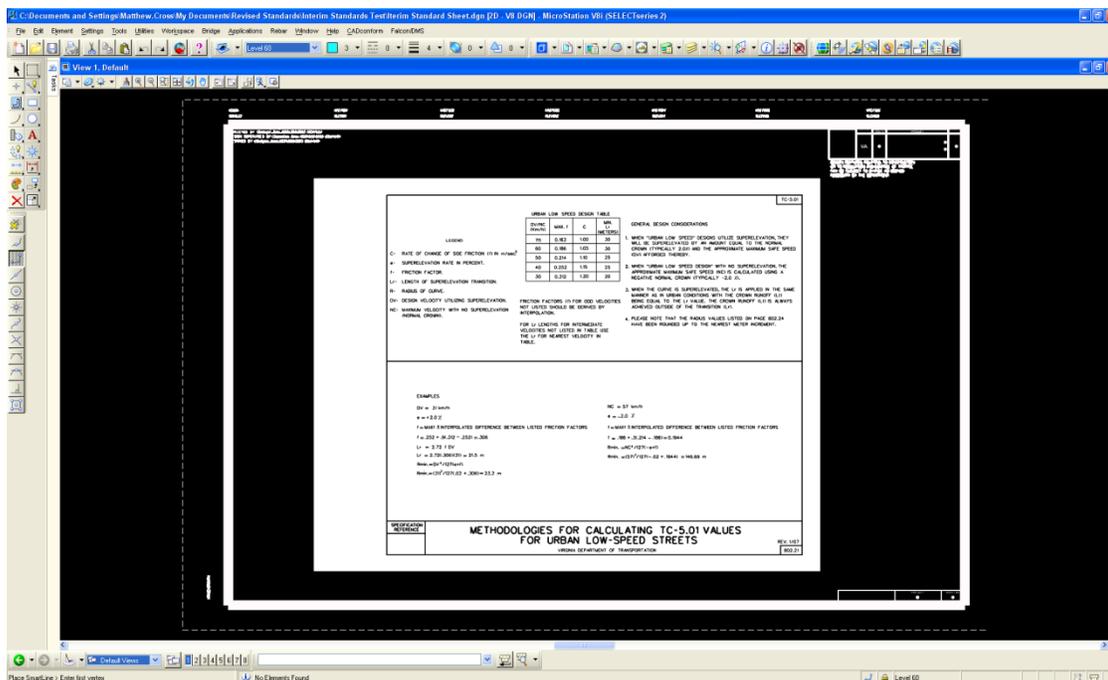

- Once you have created the file open the file and you should see a blank VDOT border sheet with a light blue shape inside the border sheet. Be sure to set your active level to **Level 1**.

- Highlight the PDF file you want to reference to the MicroStation sheet and use “**Attach Raster Interactive**” from the Falcon DocMan menu and snap to the bottom left corner of the light blue shape and then to the top right corner.

- Turn Level 62 off so that the light blue shape will not plot.

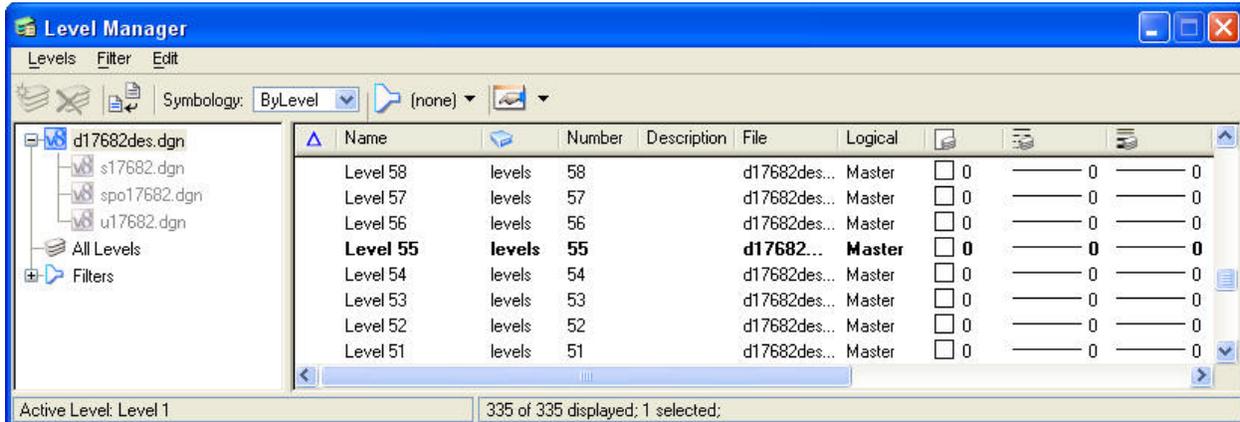

**Note: The PDF insertable sheet file will need to be archived with the project plans.**

## 3.11 Plotting

### 3.11.1 Plotting with MicroStation

Before plotting in MicroStation, open the **Level Manager** under **Settings**. Make sure that the appropriate levels are on/off in your design and reference files. The Plot column indicates whether elements on the level will print.

To ensure the integrity of the project, place a note in the file(s) when particular level(s) are off for plotting.

**Note:** The level on/off set-up for reference files **does not** update automatically when changes are made and settings are saved in those separate design files. If different levels need to be on/off other than when the file was initially set up, they must be toggled on/off manually, and then the settings saved to retain the new settings.

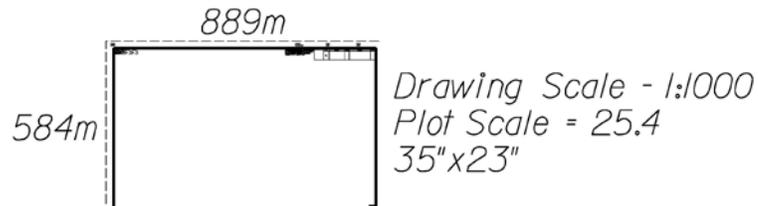

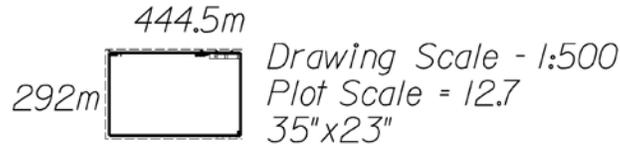

When levels are adjusted as a temporary measure, it is suggested the designer use the Save View method or close and exit the file without saving the settings. Also, be sure that the option 'Save Settings on Exit' is not toggled under **Workspace** → **Preferences** → **Operation**. The Default is no check mark.

#### 3.11.1.1 Sheet sizes

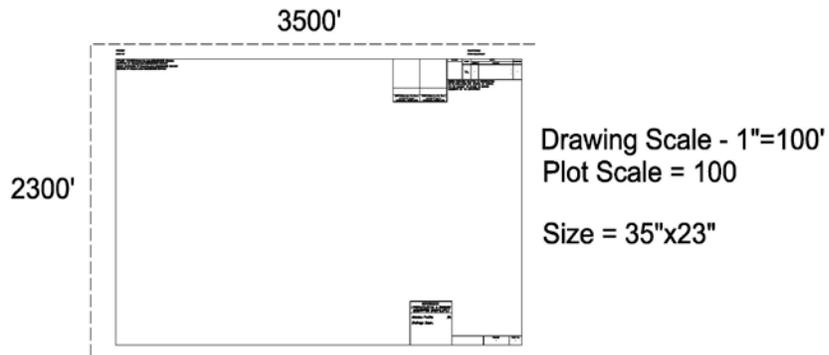

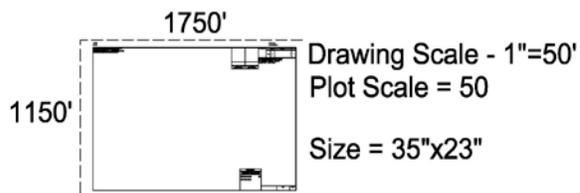

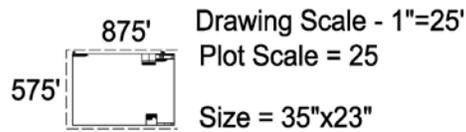

SHEET SIZE, SCALE and PLOT INFORMATION				
SHEET SIZE	DRAWING SCALE		PLOT SCALE	
	Imperial	Metric	Imperial	Metric
35"x23"	1"=25'	1:250	25	6.35
35"x23"	1"=50'	1:500	50	12.7
35"x23"	1"=100"	1:1000	100	25.4

### Figure 3-10 Sheet Plotting Scales

#### Metric Plotting

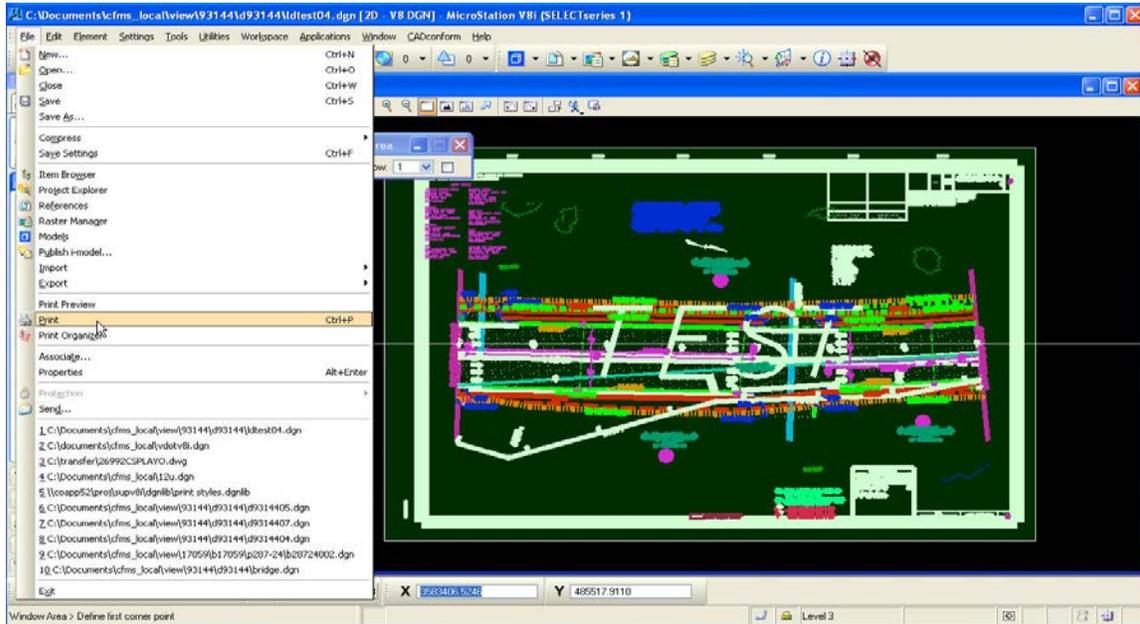

#### Imperial Plotting

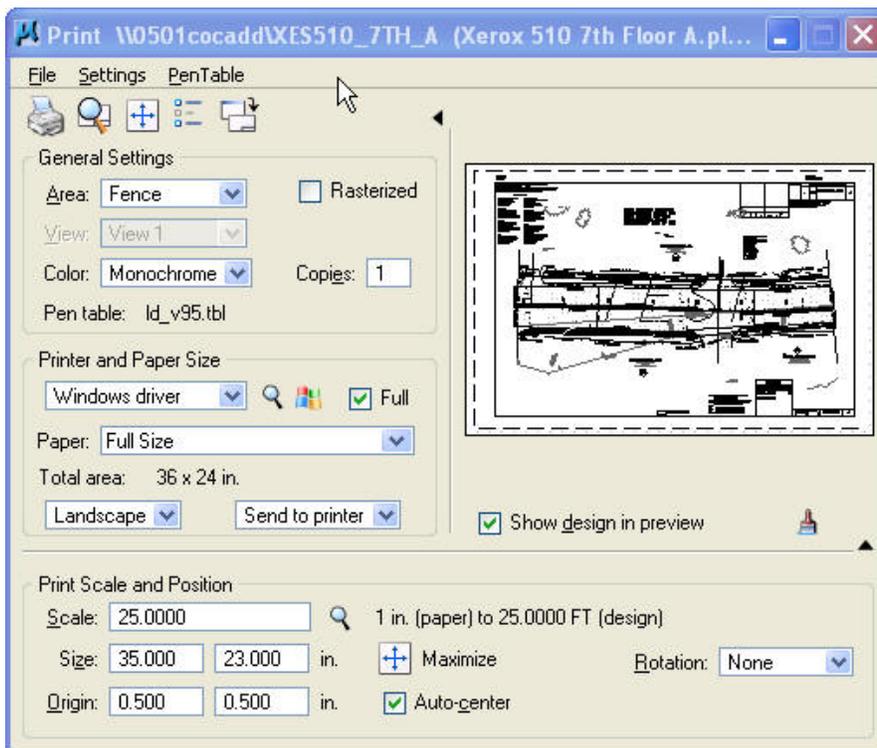

### 3.11.2 Plotting with MicroStation V8i

Place a **Fence** around the drawing. Turn line weights on if you want line weights on your plot.

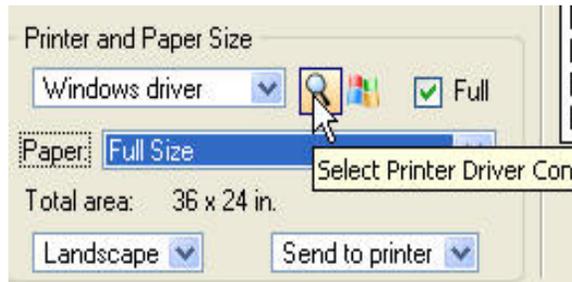

Go to **File** on the **Main MicroStation Menu** and select **Print**:

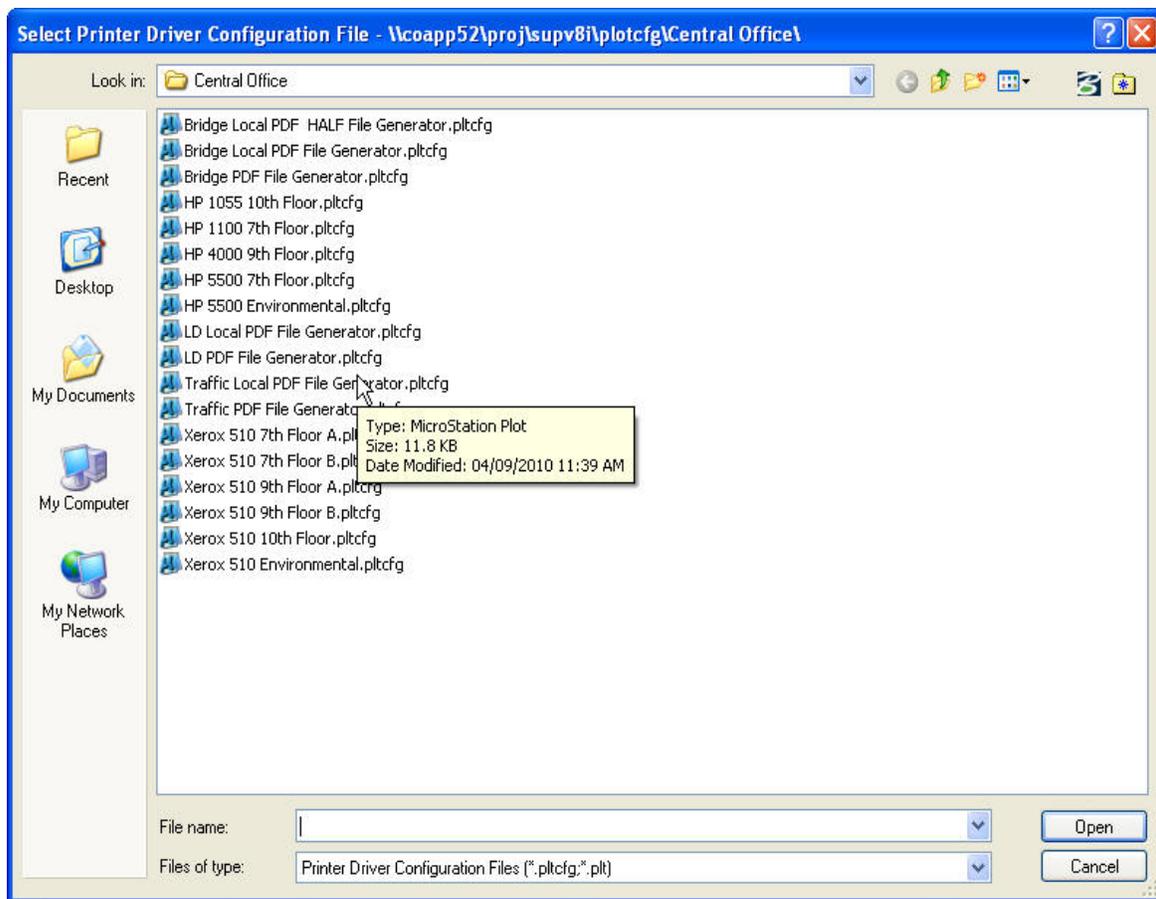

The following **Print Menu** dialog box will appear:

Select a **Printer Driver** by clicking on the Magnifying Glass icon to browse to the driver list.

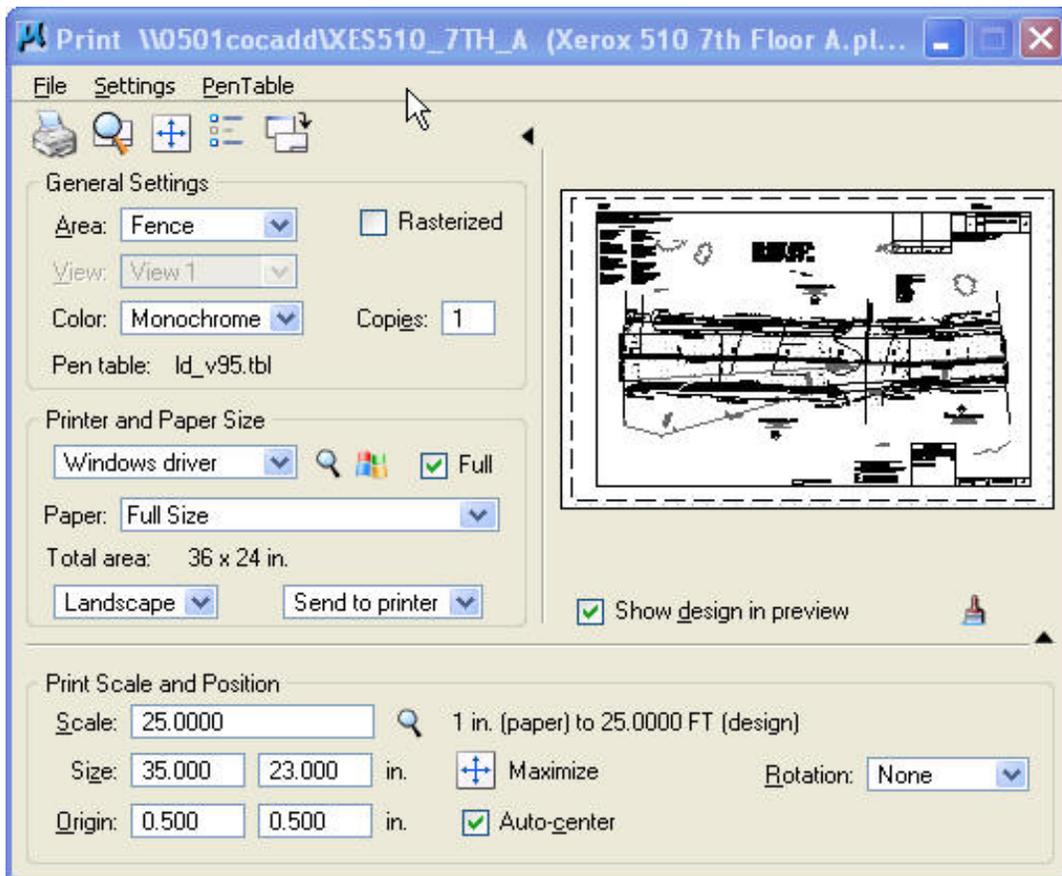

Pick the **Driver** according to the name and location of the plotter:

**Note:** Defaults are set within the Driver Configuration. You only have to pick the driver once. MicroStation will remember where you plotted last.

Verify that the following information is correct before submitting the plot:

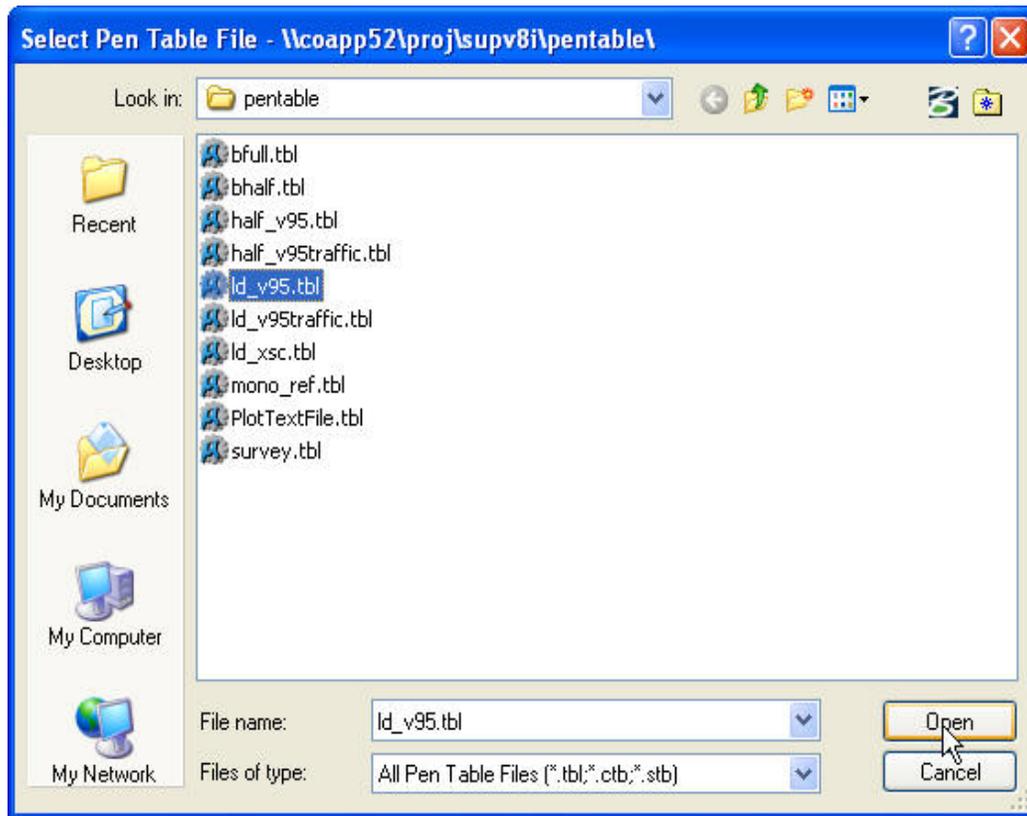

- **Area** – Should be set to **Fence** unless plotting the entire view window
- **Color** – Should be **Monochrome** if plotting in black and white
- **Paper** – **Full Size** or **Half size**
- **Pen table** – Select the appropriate **pen table** if not already set
- **Scale** – Key in the appropriate **scale** if not already set

Attach a Pen Table:

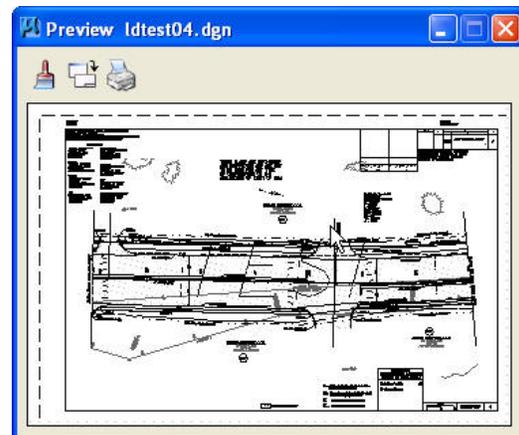

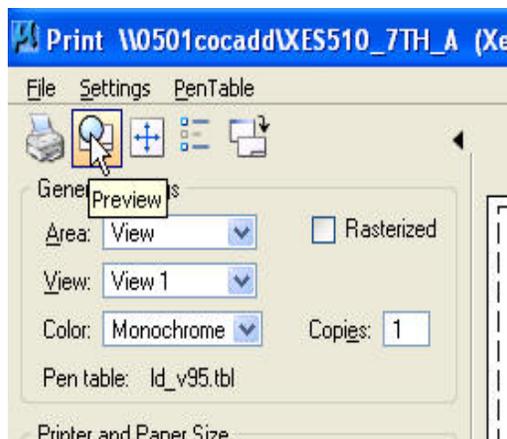

Browse and select the appropriate **Pen Table**:

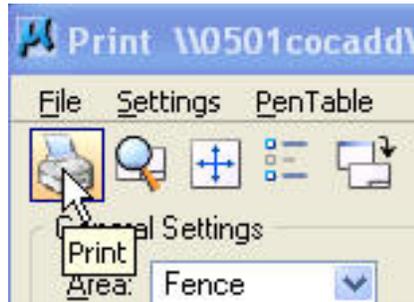

Select **Open**:

“**Preview**” option is available if needed, recommended that you use it.

Select **File** → **Print**:

### 3.11.2.1 Logical Names and Plotting

**Logical Names** are now being used to **change the line weights, subdue the survey, and screen reference files**. This is quite different than how eQuorum handled survey files and reference files in the past. eQuorum used the file name to change attributes. **All MicroStation pen tables have been set up to match existing plots.**

Logical Names must be entered as follows:

- Logical Name = *survey* – (all survey reference files must have the word *survey* at the beginning of the logical name) . Specific survey files will need to be named as shown below.)
- Logical Name = *survey\_bndy* (survey boundary files – sUPC#bd files only)
- Logical Name = *survey\_utility* (survey utility files – sUPC#su files only)
- Logical Name = *parcel* (survey parcel files – sp###UPC# files only)
- Logical Name = *pattern* (all referenced pattern files must have the word *pattern* at the beginning of the logical name)
- Logical Name = *design* (all referenced design files must have the word *design* at the beginning of the logical name)

#### Pen Table settings: (ld\_v95.tbl)

**Logical Name *design*** – This assigns priority 10 to the design files. They will be the last file to plot.

**Logical Name *pattern*** – This assigns priority 1 to the pattern files. They will be the first file to plot. The screening of the patterning is set to 25%.

**Logical Name *survey*\*** – This assigns priority 2 to the survey files. They will be the second file to plot. The screening of the survey is set to 60%. Line weight of 0 is assigned.

**Pen Table settings: (ld\_v95\_utilities-Color.tbl)** - This will be used by Design to produce the UT utility sheets for UFI supplemental plans. Apply Print Style UT\_Sheets example shown below.

**Logical Name survey\_bndy** – This assigns priority 10 to the survey files. They will be the last file to plot. Prints the Survey boundary features in black and white.

**Logical Name survey\_utility** – This assigns priority 10 to the survey files. They will be the last file to plot. Prints the Survey utility features in color.

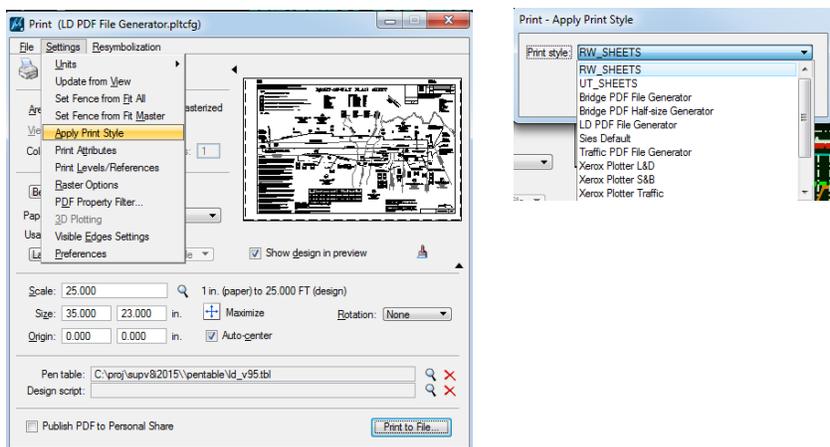

**Logical Name survey** – This assigns priority 3 to the survey file. They will be third file to plot. Prints the Survey utility features in color. The screening of the patterning is set to 70%.

**Logical Name design** – This assigns priority 2 to the survey files. They will be the second file to plot. The screening of the survey is set to 75%.

**Logical Name pattern** – This assigns priority 1 to the pattern files. They will be the first file to plot. The screening of the patterning is set to 15%.

**Pen Table settings: (rw\_sheet.tbl)** - This will be used by Survey to produce the RW sheet pdf files only. Apply Print Style RW\_sheets example shown below.

**Logical Name parcel** – This assigns priority 10 to the parcel files. They will be the last file to plot in color.

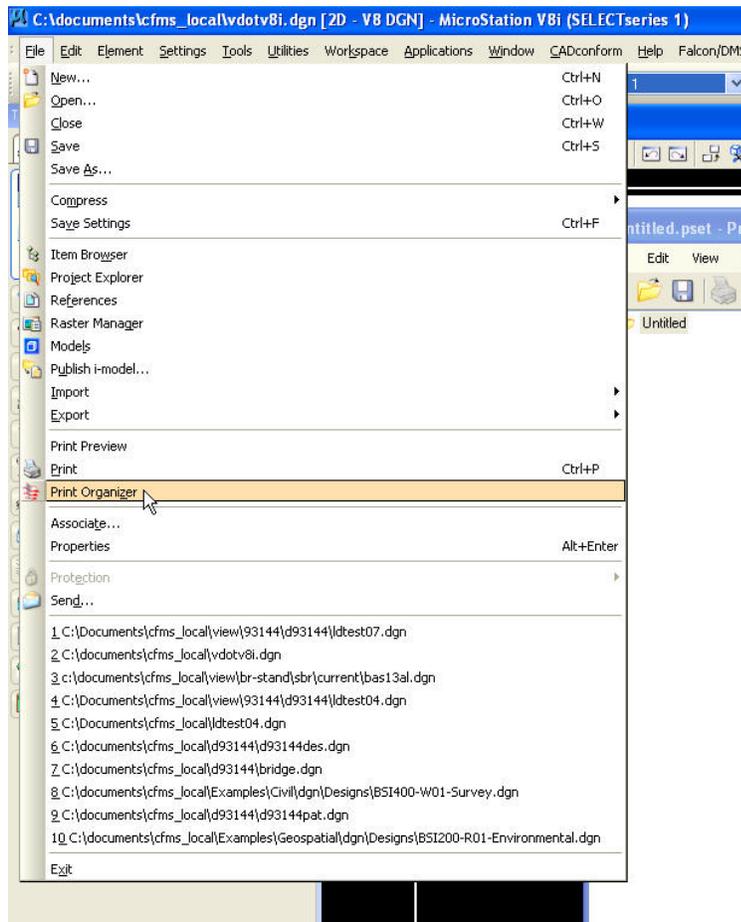

**Note:** Elements within the **survey property owners** file that equal a line **weight of 7** and on **level 54** will be assigned priority 3. They will be the third file to plot. No screening is applied. Line weight of 7 is assigned to the selected elements.

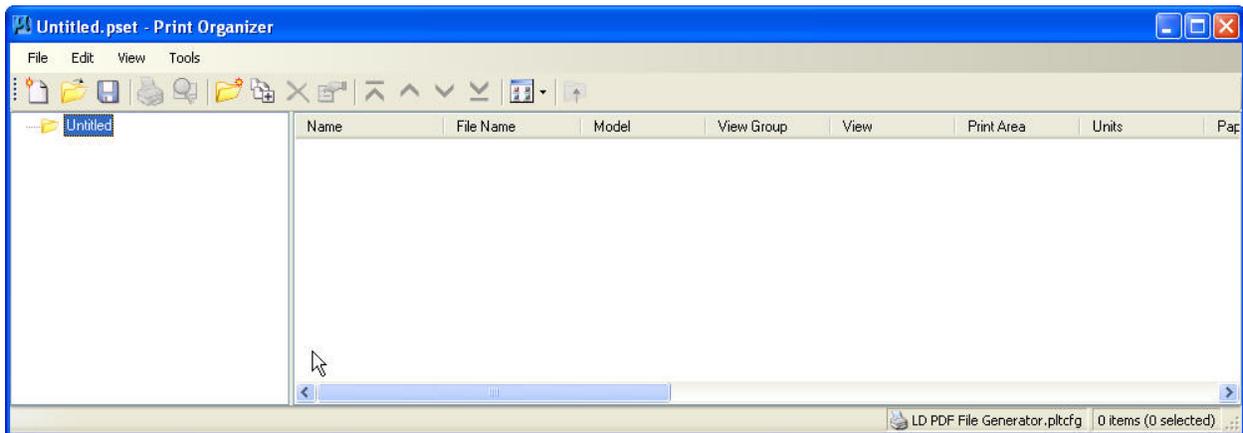

**Text Substitutions:** We are also using text substitutions to display the **Date, Time, Filename, and Plotted By** information on the plot.

### 3.11.3 Print Organizer (Batch Plotting)

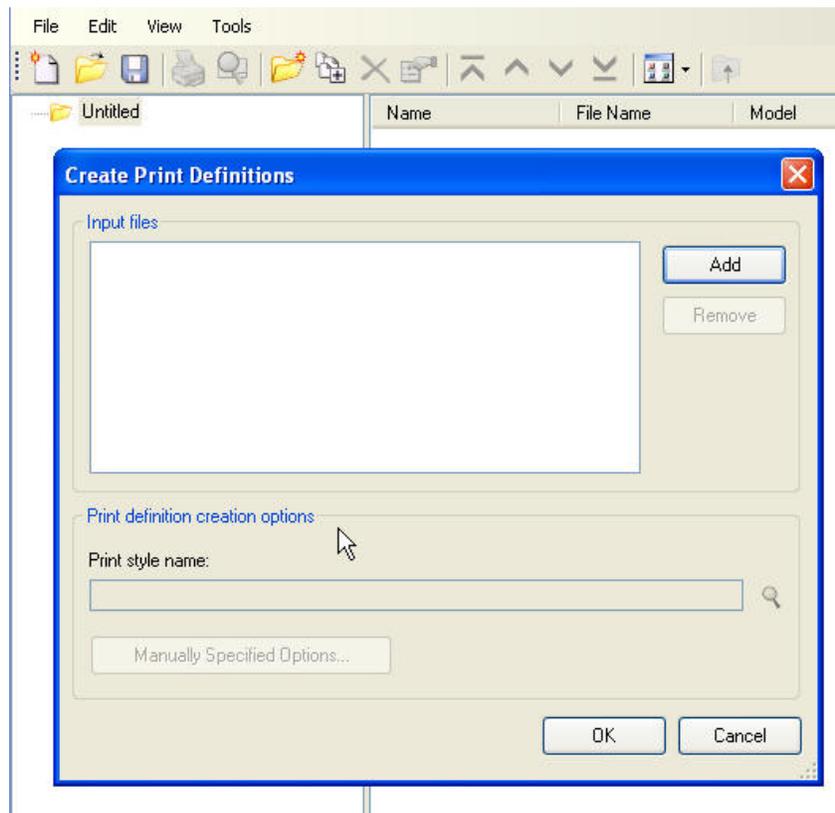

1. Go to File on the Main MicroStation Menu and select Print Organizer

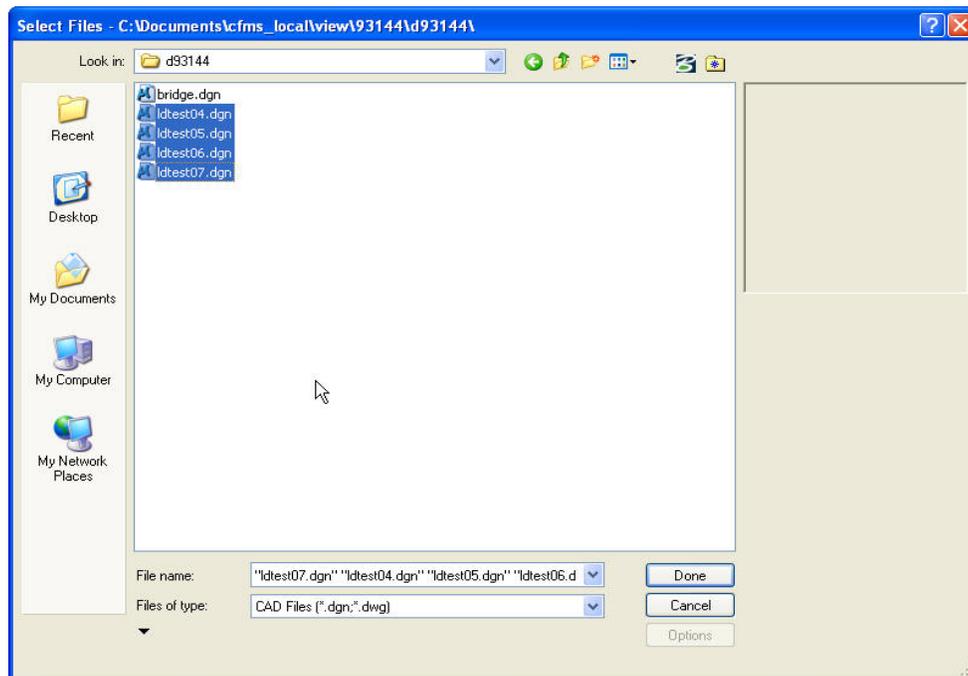

2. The Print Organizer dialog box will appear:

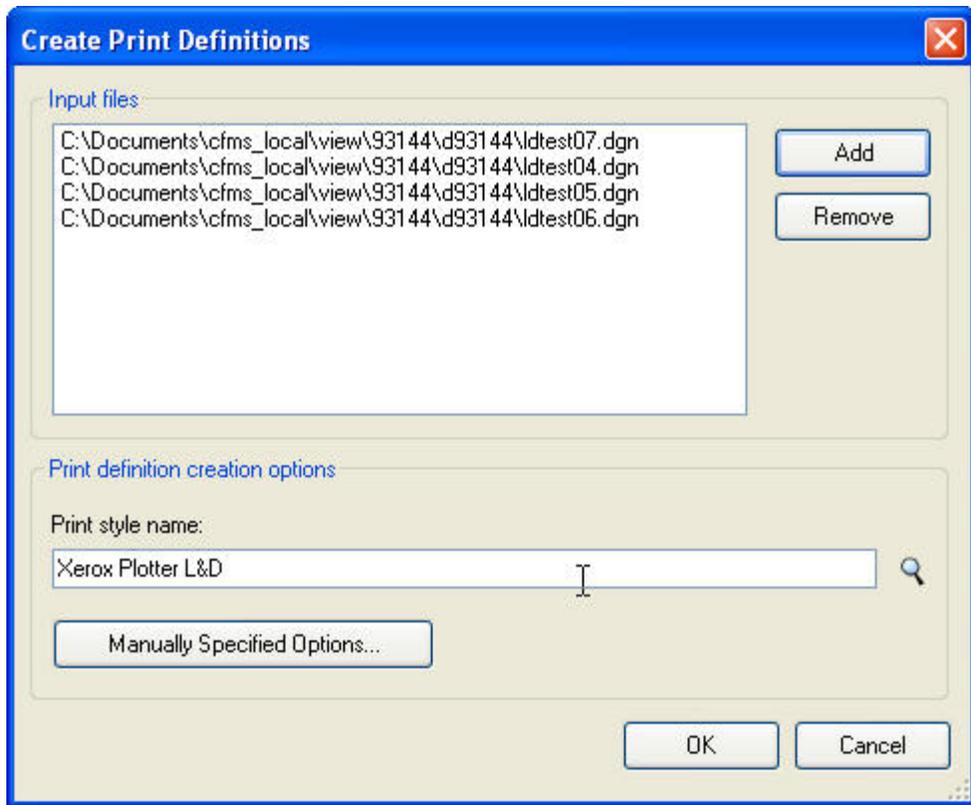

3. Go to **File** → **Add Files to Set**
4. Select **Add**:

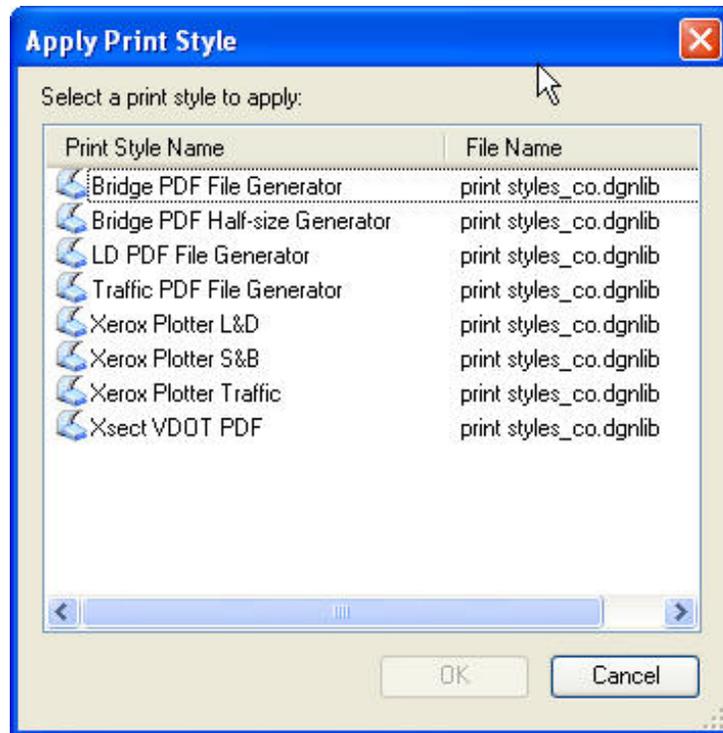

5. Then **Browse** to the files. Select the files and click **Done**.

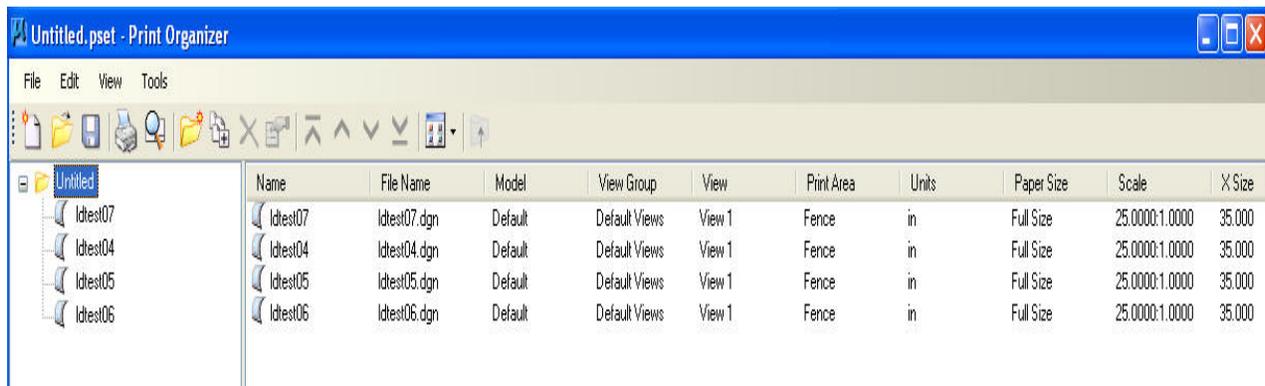

6. Choose the **Print Style Name** next by selecting the Magnifying glass:

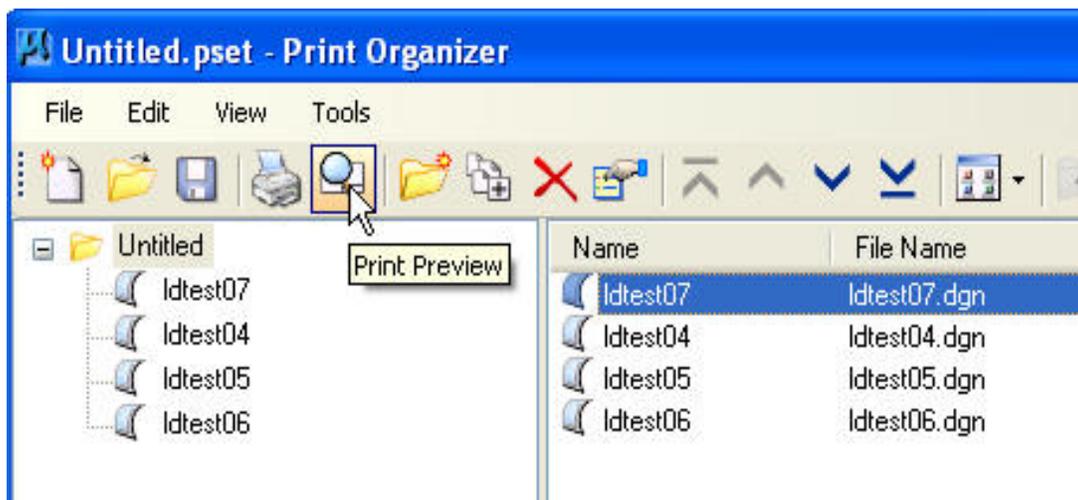

7. Highlight the **Print Style** and click on **OK**.

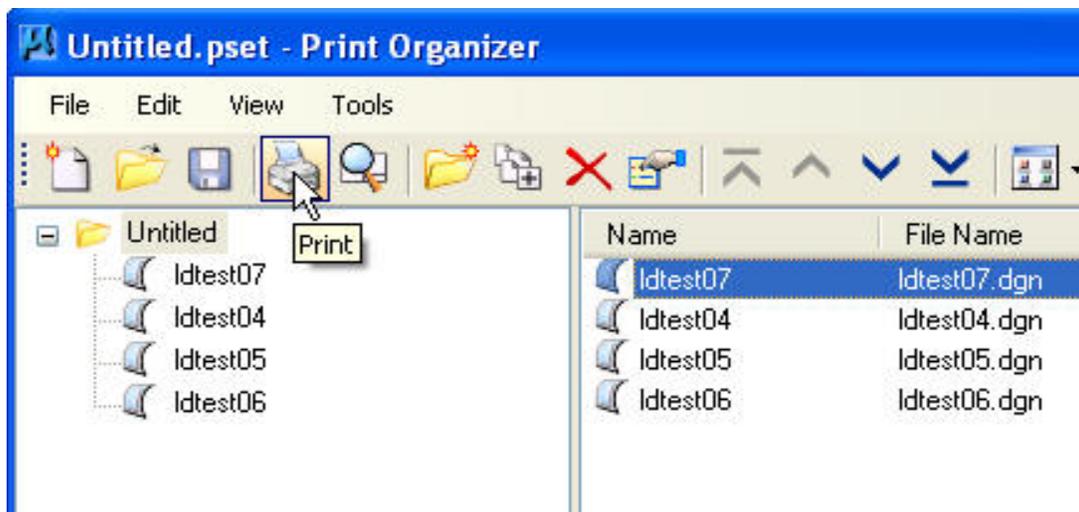

8. The **Print Organizer** dialog box should look like this now:

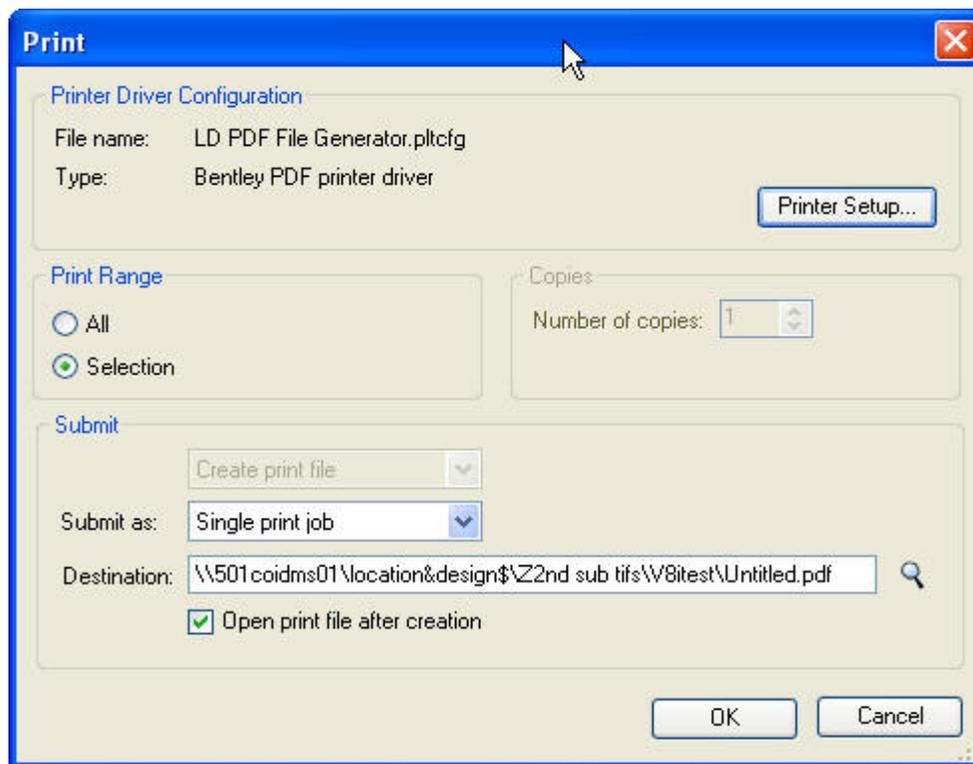

9. Review the settings and choose **Print Preview** if you would like to verify if the plot is correct:

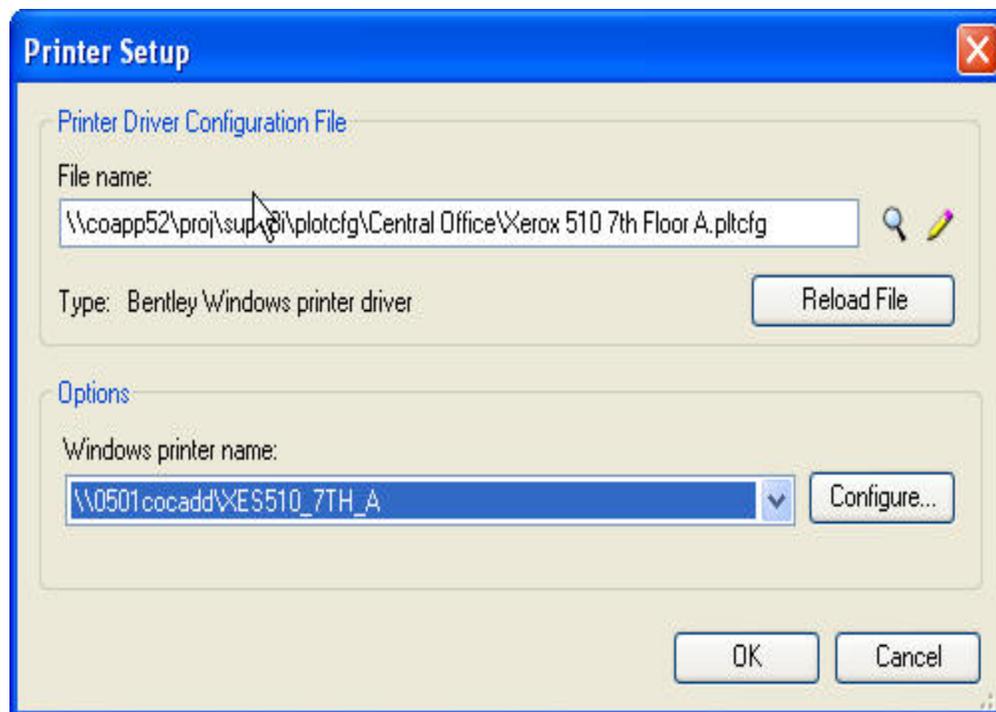

10. Select **Print**:

11. The following **Print** Dialog box should appear. Select **Printer Setup**.

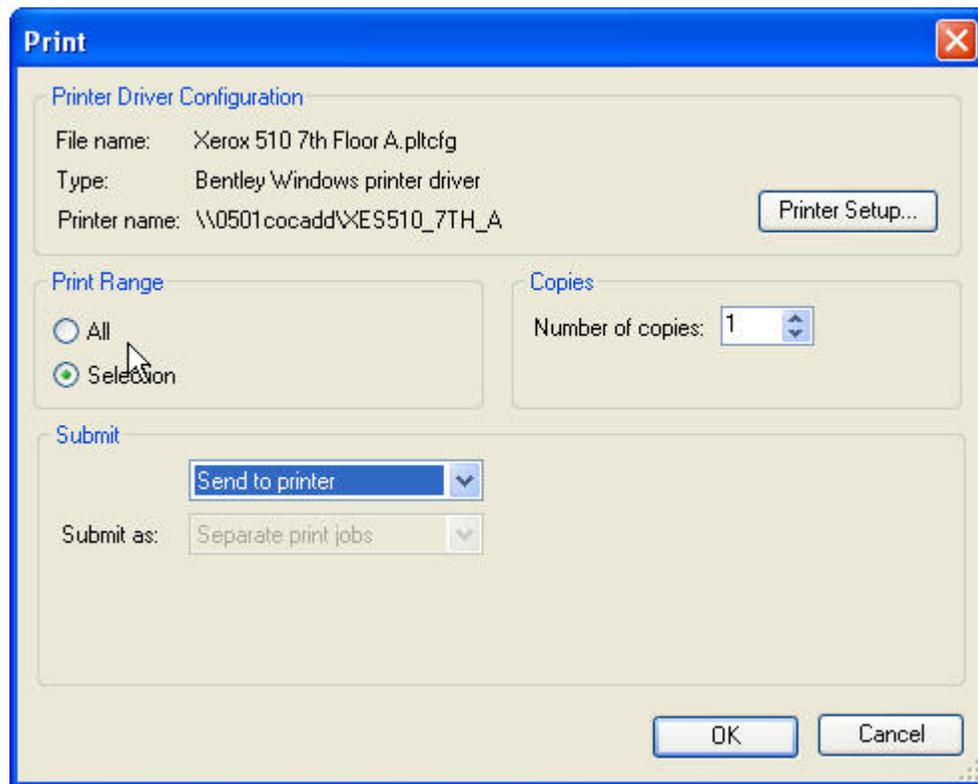

12. The following **Printer Setup** dialog box should appear:

Choose the correct **Driver Configuration File** and **Windows Printer Name** (Printer should default correctly, if not choose the Printer)

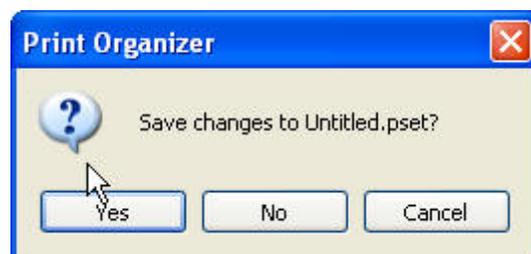

13. Select **OK**

14. The **Print** dialog box should reappear:

15. Select **OK**. The prints should now come out on the plotter.

16. Close **Print Organizer**:

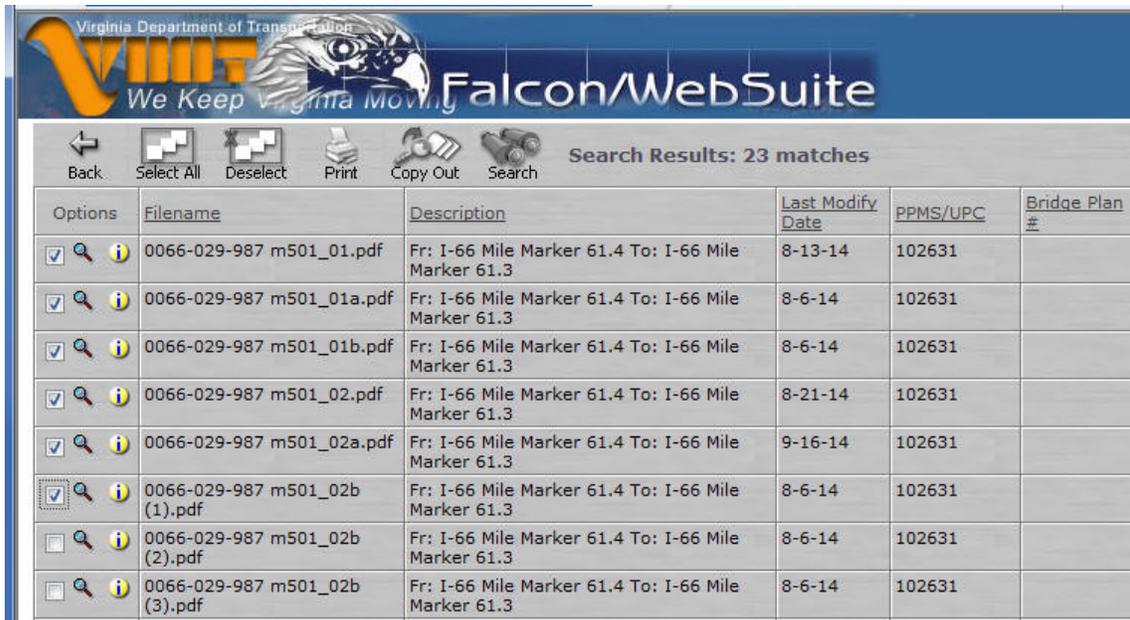

17. Select **No**. (Do not save the changes)

### 3.11.4 Plotting from Falcon Web

VDOT Falcon/Web site allows you to Search, View, and Print documents over the Intranet using a browser and the appropriate plugins. You can use the Print Application to print one or multiple files.

#### 3.11.4.1 Using the Print Application

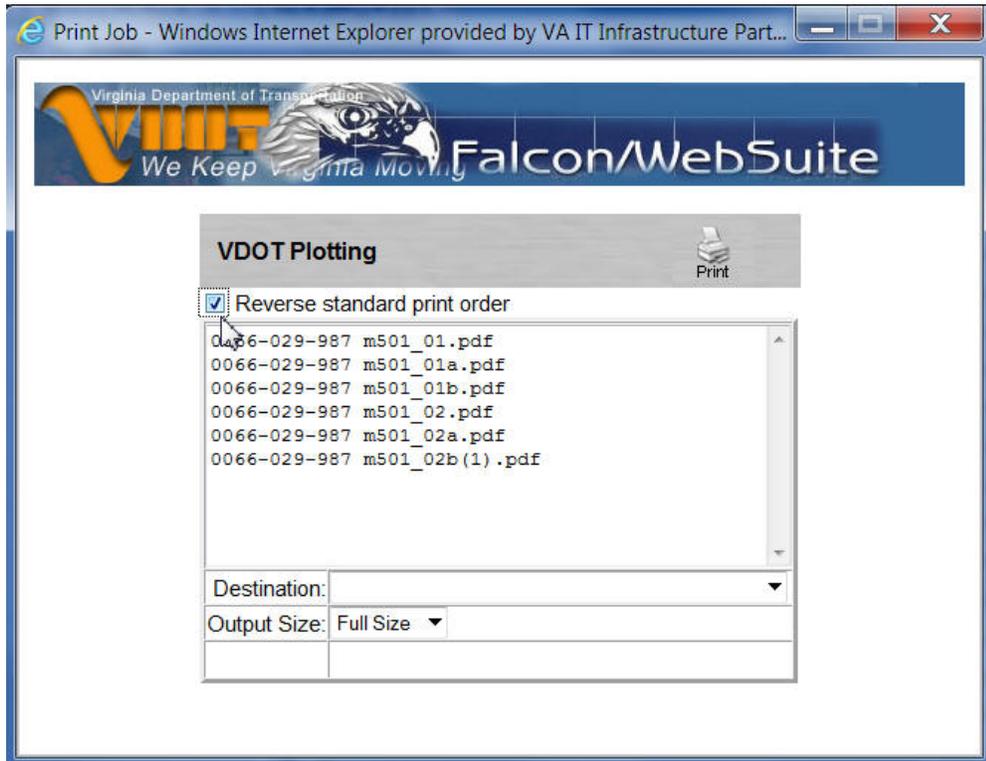

1. Select files to be printed by checking the check boxes under the **Options** column.

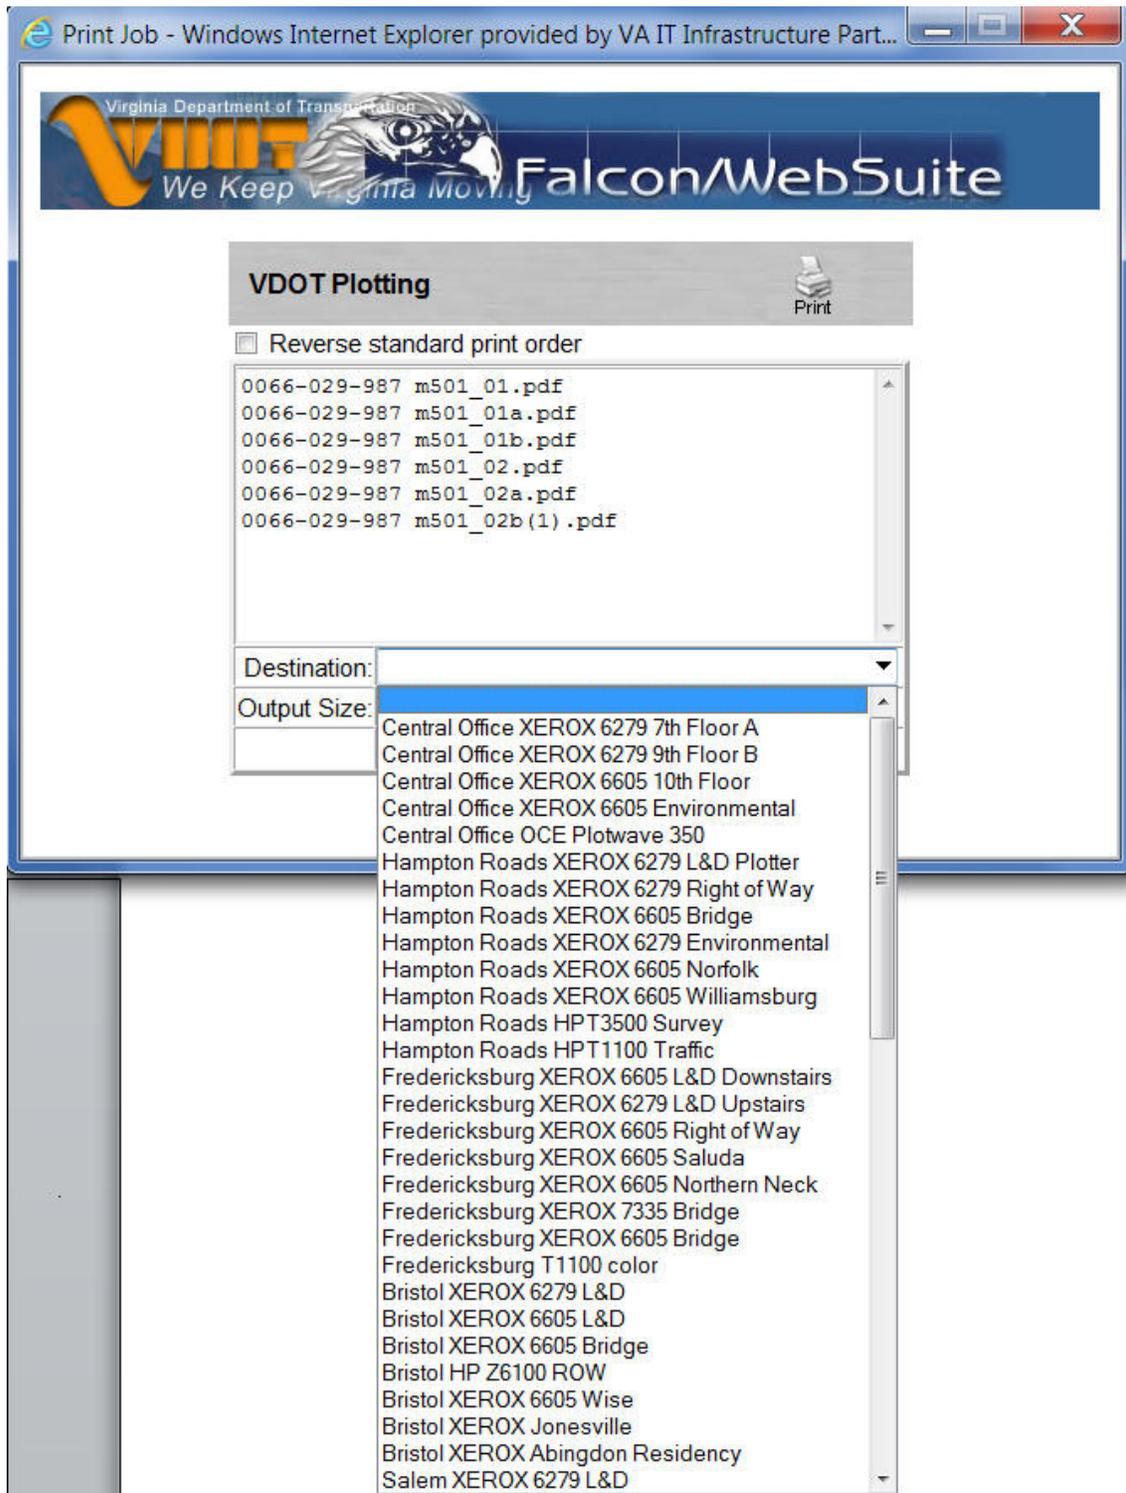

2. Click on the **Print** icon.

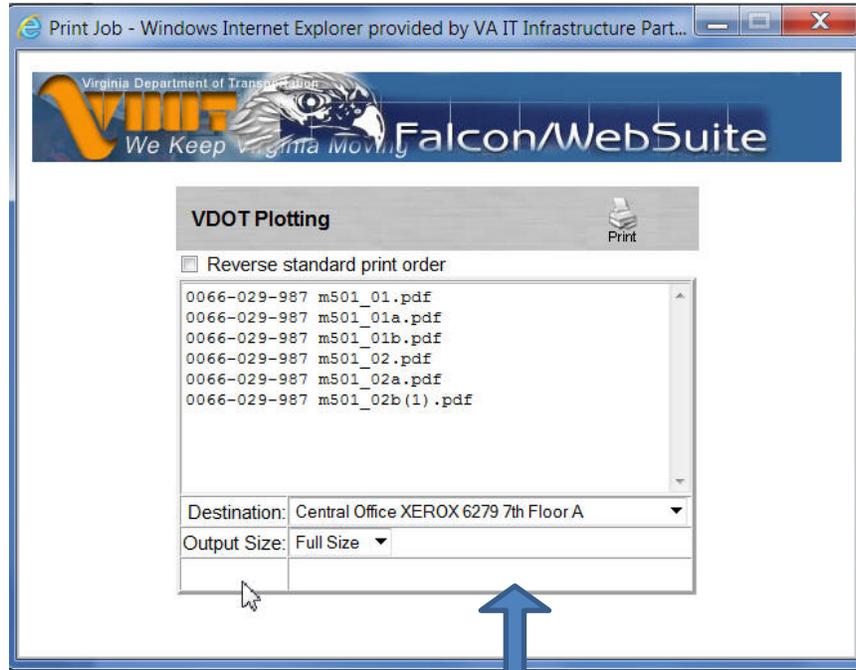

3. Click on the “**Reverse standard print order**” check box so plan sheets will come out in the correct order.

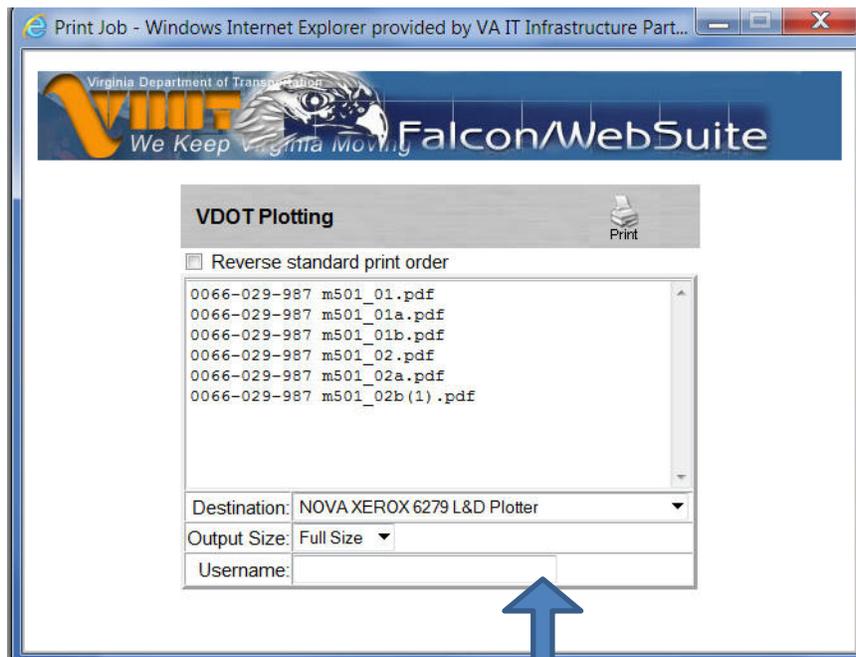

4. Choose the **Destination** of the plotter. There are multiple plotters to choose from in the Central Office and Districts.

5. According to the **Destination** plotter chosen, there is an option in the code that depending on the plotter selection it may require a **user name**, however most plotters do not require a user name.

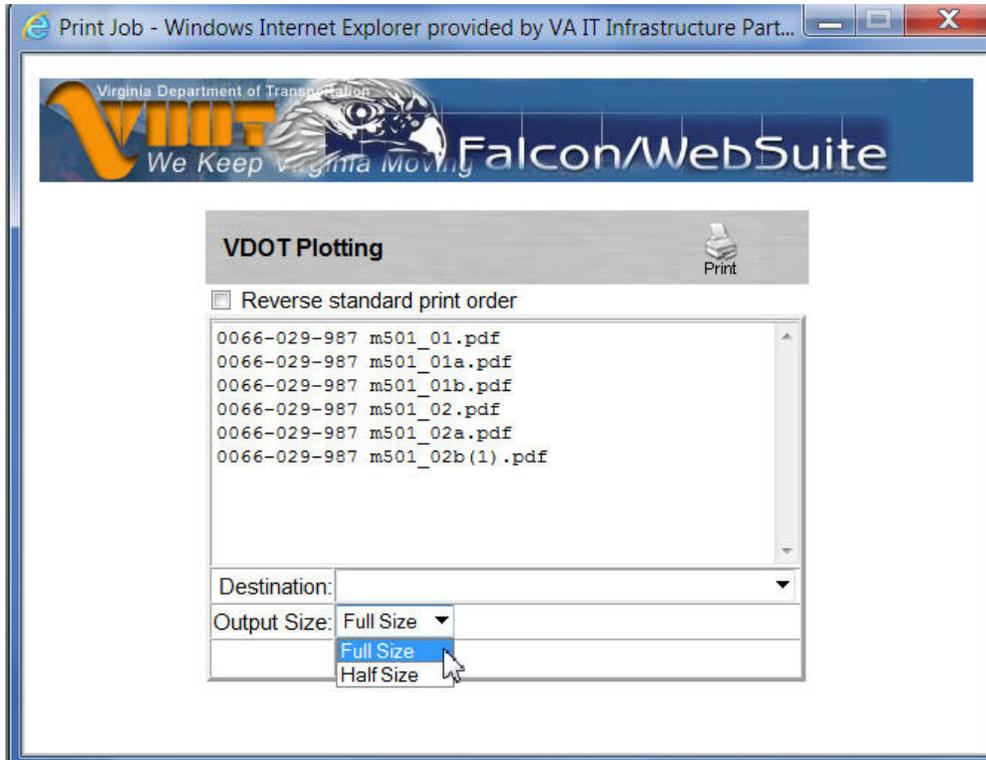

**No User Name Required**

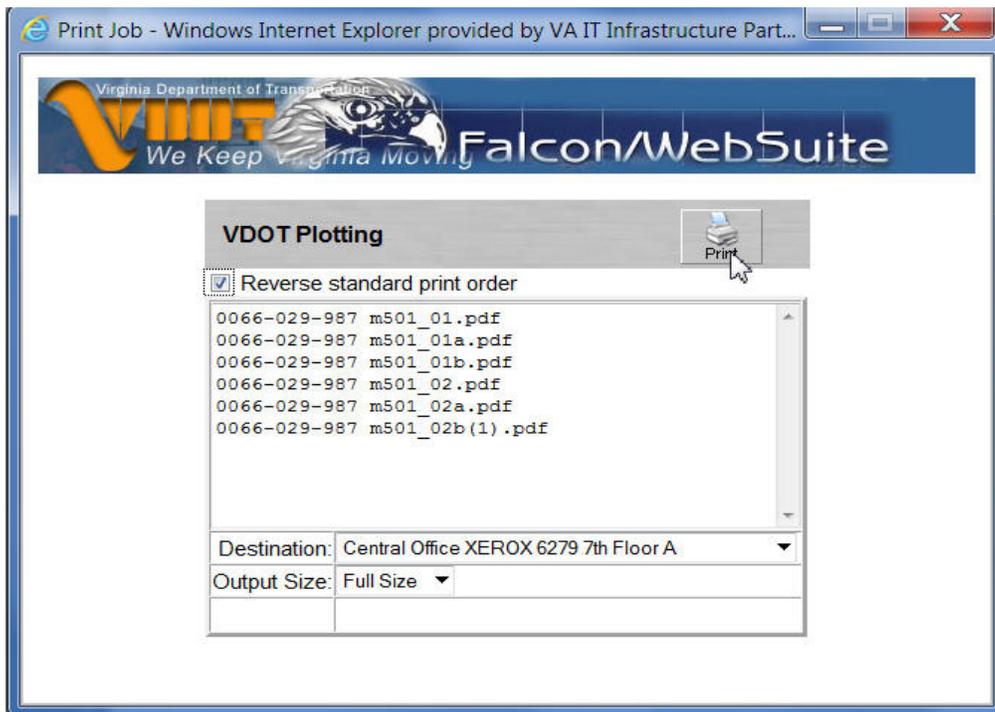

**User Name Required**

+

6. Choose the **Output** size Full Size or Half Size..

7. Click the **Print** icon.

8. Prints have been sent to the plotter. Click on the **Close** button to exit.
