

HEC-RAS

Version 2.3

Training Manual/Self Study Guide

Preface

The HEC-RAS computer program was developed by the U.S. Army Corps of Engineers at their Hydrologic Engineering Center (HEC), 609 Second Street, Davis, California 95616. The software was designed by Mr. Gary W. Brunner, leader of the HEC-RAS development team.

This training manual was written by Clyde B. Giaquinto, who is a civil engineer with the United States Department of Agriculture - Natural Resources Conservation Service, Syracuse, New York. The preparation of this manual used many portions of CPD-68, HEC-RAS River Analysis System, User's Manual. Some of the text in this manual was taken verbatim from the HEC-RAS River Analysis System, User's Manual as is available from the Hydraulic Engineering Center's home page at <http://www.hec.usace.army.mil>.

The purpose of developing this manual is two fold. First, it is intended to provide a choice as to the method of learning the HEC-RAS program from the various choices and sources available and secondly, to provide a cost efficient means whereby a person may become knowledgeable of the program's capabilities. It is estimated that if a person carefully follows the instructions in this manual, approximately two days would be required to complete the training.

This manual is intended for use as a self teaching aid whereby the user could sit at the keyboard and follow the instructions in this manual and thereby learn the essentials of the computer program. Throughout the chapters in this manual, many of the tasks are repeated so as to provide the user with the experience necessary to accomplish a practical application. This manual can also be used in a class room setting with an instructor as a facilitator and the users performing essentially the same routine as in a self teaching mode. To enhance the class room setting it is suggested that separate exercises be used as additional learning tools.

The models developed as a result of following the pages in this manual do not depict any actual or real project. Its development is merely a result of the development of this training manual.

This manual is not intended to cover 100 percent of the capabilities of the HEC-RAS program. For additional modeling capabilities and alternatives, the user should consult the Hydraulic Reference Manual, Applications Guide and Users Manual that were prepared by the U.S. Army Corps of Engineers, Hydrologic Engineering Center.

Table of Contents

Preface iii

Chapter 1 - Introduction 1

General Philosophy of the Modeling System 1

Overview of Program Capabilities 1

User Interface 1

Hydraulic Analysis Components 1

Data Storage and Management 1

Graphics and Reporting 1

Chapter 2 - Working with Projects 3

Understanding Projects 3

Elements of a Project 3

Plan Files 3

Run Files 3

Output Files 3

Geometry Files 4

Steady Flow Data Files 4

Hydraulic Design Data Files 4

Creating, Opening, Saving, Renaming and Deleting Projects 4

Project Options 5

Chapter 3 - Model Development 9

Starting a New Project 9

Entering Geometric Data 10

Schematic of the Watercourse 10

Saving the Geometry File 11

Entering Cross-section Data 12

Add a New Cross-section 12

River, Reach and River Station 12

Description 13

Cross-section X & Y Coordinates 13

Downstream Reach Lengths 13

Manning's "n" Values 13

Main Channel Bank Stations 14

Contraction and Expansion Coefficients 14

Cross-section Options 15

Copy Current Cross-section 15

Adjust Elevations 16

Stream Junctions 20

Entering Junction Data 20

Selecting a Modeling Approach 21

Performing a Steady Flow Analysis 22

Entering and Editing Steady Flow Data 23

Steady Flow Data 23

Boundary Conditions 23

Steady Flow Data Options 23

Saving Steady Flow Data 24

Performing Steady Flow Calculations 24

Defining a Plan 24

Saving the Plan Information 24

Simulation Options 25

Starting the Computations 25

Chapter 4 - Viewing Results 27

Cross-sections, Profiles and Rating Curves 27

Table of Contents

Viewing Graphics on the Screen	27
Graphical Plot Options	28
Plotting Velocity Distribution Output	29
Plotting Other Variables in profile	31
Plotting One Variable vs Another	31
Sending Graphics to a Printer or Plotter	32
Sending Graphics to a Windows Clipboard	32
X-Y-Z Perspective Plots	32
Tabular Output	33
Cross-section Tables	33
Cross-section Table Options	34
Profile Tables	35
User Defined Output Tables	36
Sending Tables to a Printer	38
Sending Tables to the Windows Clipboard	38
Sending Tables to a Text File	39
Viewing Results from the River System Schematic	39
Chapter 5 - Editing Geometric Data	41
Adding Tributaries to an Existing Reach	41
Editing the Schematic	41
Change Name	41
Move Object	41
Add Points to a Reach	42
Remove Points in a Reach	43
Delete Reach	43
Delete Junction	43
Reach Schematic Lines	43
Cross-section Schematic Lines	45
Editing Cross-sections	45
Rename River Station	45
Delete Cross-section	46
Adjust Stations	47
Adjust “n” Values	49
Ineffective Flow Areas	49
Levees	51
Blocked Obstructions	52
Add a Lid to Cross-sections	53
Horizontal Variation in “n” Values	53
Horizontal Variation in “k” Values	54
Set Maximum Station/Elevation Points	56
Undo Editing	56
Cut, Copy and Paste	56
Delete	57
Insert	57
Cross-section Interpolation	57
River Ice	57
Entering and Editing Ice Data	57
Entering Ice Data at a Cross-Section	57
Ice Cover Thickness	58
Ice Cover Manning’s n Values	58
Ice Cover Specific Gravity	58
Wide River Ice Jam	58
Internal Friction Angle of the Jam (degrees)	58
Ice Jam Porosity (fraction water filled)	59

Coefficient K1 (longitudinal to lateral stress in jam)	59
Maximum mean velocity under ice cover	59
Ice Cohesion	59
Fixed Manning's n Value (or Nezhikovsky's data will be used)	59
Entering Ice Data Through a Table	59
Entering Ice Data at Bridges	59
No ice computed in the bridge	60
Ice Remains constant through the bridge	60
Dynamic ice jam computed through the bridge	60
Setting Tolerances for the Ice Jam Calculations	60
Ice thickness calculation tolerance	60
Global ice thickness calculation tolerance	60
Global water level calculation tolerance	60
Maximum number of ice jam iterations	60
Viewing and Editing Data Through Tables	61
Manning's "n" or "k" Values	61
Reach Lengths	62
Expansion and Contraction Coefficients	63
River Stations	63
Plotting Cross-section Data	64
Performing the Hydraulic Calculations	64
Viewing Results	67
Cross-section Plots	67
Profile Plots	67
Rating Curves	68
X-Y-Z Perspective Plots	69
Tabular Output at a Specific Cross-section	70
Tabular Output at Many Cross-sections	70
Manipulating Tabular Output	70
Printing Graphics and Tables	70
Sending Graphics to the Windows Clipboard	71
Sending Tables to the Windows Clipboard	71
Sending Tables to a Text File	71
Exiting the Program	72
Chapter 6 - Bridges and Culverts	73
Cross-section Locations	73
Contraction and Expansion Losses	74
Bridge Hydraulic Computations	74
Entering and Editing Bridge Data	74
Culvert Hydraulic Computations	82
Entering and Editing Culvert Data	82
Bridge and Culvert Options	90
Bridge and Culvert View Features	91
Multiple Bridge and/or Culvert Openings	91
Entering Multiple Opening Data	91
Defining the Openings	96
Multiple Opening Calculations	98
Inline Weirs and Gated Spillways	98
Entering and Editing Inline Weir and Gated Spillway Data	99
Chapter 7 - Performing a Floodway Encroachment Analysis	103
General	103
Entering Floodway Encroachment Data	106
Performing a Floodway Encroachment Analysis	109
Viewing the Floodway Encroachment Results	109

- Chapter 8 - Trouble Shooting with HEC-RAS 113**
 - Built in Data Checking 113
 - Checking the Data as it is Entered 113
 - Checking the Data Before Computations are Performed 113
 - Errors, Warnings and Notes 114
 - Log Output 115
 - Setting Log File Output 115
 - Viewing the Log File 116
 - Reviewing and Debugging the Normal Output 116
 - Viewing Graphics 116
 - Viewing Tabular Output 117

Chapter 1 - Introduction

The current version of this program will perform steady flow analysis using a variety of flow regimes and geometric models. Input and output data is provided in graphical as well as tabular formats.

General Philosophy of the Modeling System

The HEC-RAS computer program uses a graphical user interface (GUI). The program incorporates separate hydraulic analysis components, data storage and management capabilities, graphics and reporting facilities.

Overview of Program Capabilities

HEC-RAS is designed to perform one-dimensional hydraulic calculations for a full network of natural and constructed channels and provide input and output information in tabular and graphical formats.

User Interface

The graphical user interface provides the following functions:

- File management
- Data entry and editing
- Hydraulic analysis
- Tabulation of graphical displays of input and output data
- Reporting facilities
- On-line help

Hydraulic Analysis Components

Calculates water surface profiles for steady gradually varied flow through a network of channels, dendritic systems or a single river reach. The computer program will model subcritical, supercritical and mixed-flow regime water surface profiles. The geometric model can include combinations of bridges and culverts.

Data Storage and Management

User input files are stored in separate categories of project plan, geometry, steady flow and sediment data. Output data is stored predominately in separate binary files.

Graphics and Reporting

Graphics include plots of the river system schematic, cross sections, profiles, rating curves, hydrographs and other hydraulic variables. Tabular output is available using preselected tables or user defined tables. All tabular and graphical data can be displayed or printed or pasted to the windows clipboard and then accessed by other software
